# 1. Specifications

## AUDIO AMPLIFIER SECTION

Maximum Power Output: (Front) 22 watts per channel

(Rear) 22 watts per channel

Continuous Power Output (RMS): (Front) 8 watts per channel into 4 Ω, 40 to 20,000 Hz at no more than 0.8% total harmonic distortion. (Rear) 8 watts per channel into 4 Ω, 40 to 20,000 Hz at no more than 0.8% total harmonic distortion.

Load Impedance: 4 Ω (4 – 8 Ω Allowable)

Tone Control Range

Bass: ±10 dB at 100 Hz

Treble: ±10 dB at 10 kHz

Frequency Response: 40 – 20,000 Hz

Signal-to-Noise Ratio: 60 dB

## RADIO SECTION

Frequency Range

FM: 87.5 – 107.9 MHz (C/J)

87.5 – 108.0 MHz (A/U)

AM: 530 – 1,710 kHz (C/J)

531 – 1,620 kHz (A/U)

(C: Canada, J: U.S.A., A: Australia, U: Other areas)

(FM Tuner)

Usable Sensitivity: 15.3 dBf (1.6 μV/75 Ω)

50 dB Quieting Sensitivity: 18.8 dBf (2.4 μV/75 Ω)

Alternate Channel Selectivity (400 kHz): 65 dB

Frequency Response: 40 – 15,000 Hz

Stereo Separation: 35 dB

Capture Ratio: 2.0 dB

(AM Tuner)

Sensitivity: 20 μV

Selectivity: 35 dB

## CASSETTE DECK SECTION

Wow & Flutter: 0.11 % (WRMS)

Fast Wind Time: 100 sec. (C-60)

Frequency Response:

50 – 14,000 Hz (±3 dB)

Signal-to-Noise Ratio: 52 dB

Stereo Separation: 40 dB

## GENERAL

Power Requirement:

Operating Voltage: DC 14.4 V (11 V – 16 V

Allowable)

Grounding System: Negative Ground

Dimensions (W x H x D)

Chassis: 178 x 50 x 134 mm

(7-1/16" x 2" x 5-5/16")

Nosepiece: 105 x 42 x 35 mm

(4-3/16" x 1-11/16" x 1-7/16")

Control Shaft Pitch: 148 mm (5-7/8")

Gross Weight: 1.5 kg (3.4 lbs)

*Design and specifications subject to change without notice.*

## IMPORTANT INFORMATION

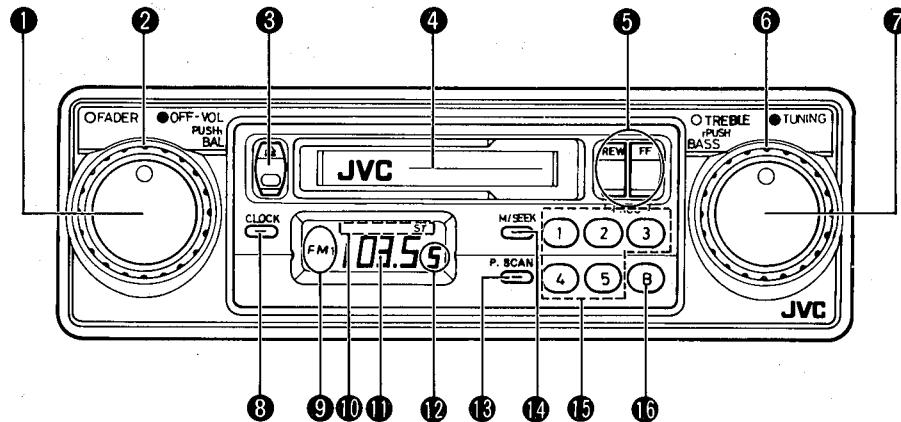

1. This unit is designed to operate with 12 volts DC, NEGATIVE ground electrical systems only.
2. Replace the fuse with one of the specified rating. If the fuse blows frequently, consult your JVC car audio dealer.
3. Do not touch the highly-polished head with any metallic or magnetic tools.
4. If noise is a problem...  
This unit incorporates a noise filter in the power circuit. However, with some vehicles, clicking or other unwanted noise may occur. If this happens, connect the unit's rear ground terminal to the car's chassis using shorter and thicker cords, such as copper braiding or gauge wire. If noise still persists, consult your JVC car audio dealer.
5. Never play dirty or dusty tapes since they will greatly degrade the sound and performance of your unit. Always keep your tapes clean.

### Antenna noise

If you can hear static noise when listening to both AM and FM, check for loose antenna connections.

## 2. Instructions

### LOCATION OF CONTROLS

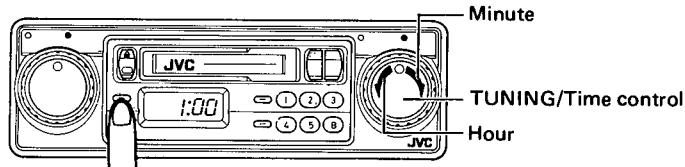

- ① Power on-OFF/volume (VOL)/Push balance (PUSH BAL) control
- ② FADER control
- ③ Eject (▲) button
- ④ Cassette loading slot
- ⑤ Program (PROG)/REW, FF buttons
- ⑥ TREBLE/PUSH BASS control
- ⑦ TUNING/Time control
- ⑧ CLOCK button
- ⑨ Band indicator (FM1-FM2-FM3-AM)
- ⑩ Indicators  
SEEK  
ST (FM Stereo)  
▲ (Tape direction)
- ⑪ Radio frequency/Time display
- ⑫ Preset station indicator
- ⑬ Preset scan (P. SCAN) button
- ⑭ Manual (M)/SEEK button
- ⑮ Preset station buttons
- ⑯ Band (B) button

### DIGITAL CLOCK DISPLAY

When listening to a tape, the display will show the time. When listening to the radio, each time the CLOCK button is pressed the time and frequency can be selected. When the radio is operated in the time mode, the display will switch to frequency, then, after a short time, will return to the time mode. To cancel the time mode, press the CLOCK button again.

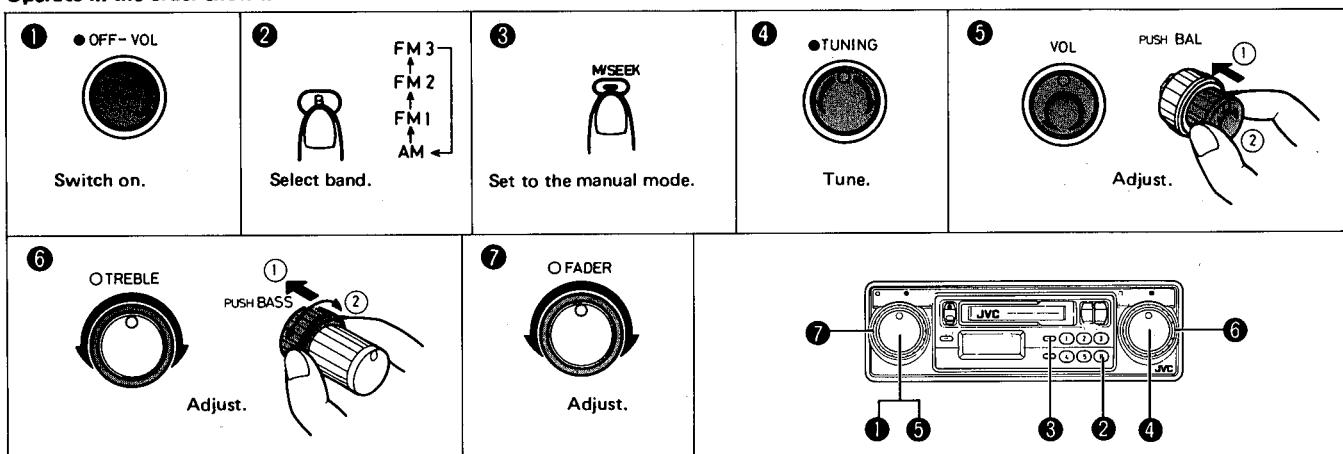

• **To adjust the time**

When the display is in the time mode, while keeping the CLOCK button pressed, turn the Tuning control counterclockwise to adjust the "hours" and turn the Tuning control clockwise to adjust the "minutes".

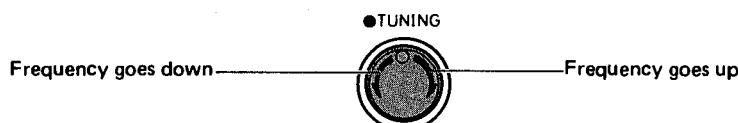

## RADIO OPERATION

Operate in the order shown.

### MANUAL TUNING

Set to the manual mode using the M/SEEK button. When SEEK is not shown in the display, the unit is in the manual mode. The Tuning control will not lock in place; it automatically returns to its center position when released. Keep the control in position for more than 0.5 second to change frequencies rapidly. You can step through the frequency in 200 kHz units (C/J version) or 100 kHz units (A/U version) for FM and 10 kHz units (C/J version) or 9 kHz units (A/U version) for AM.

### SEEK TUNING

Set to the seek mode using the M/SEEK button; the SEEK indicator will light. Then, by turning the Tuning control the unit tunes to the adjacent station with a higher or lower frequency.

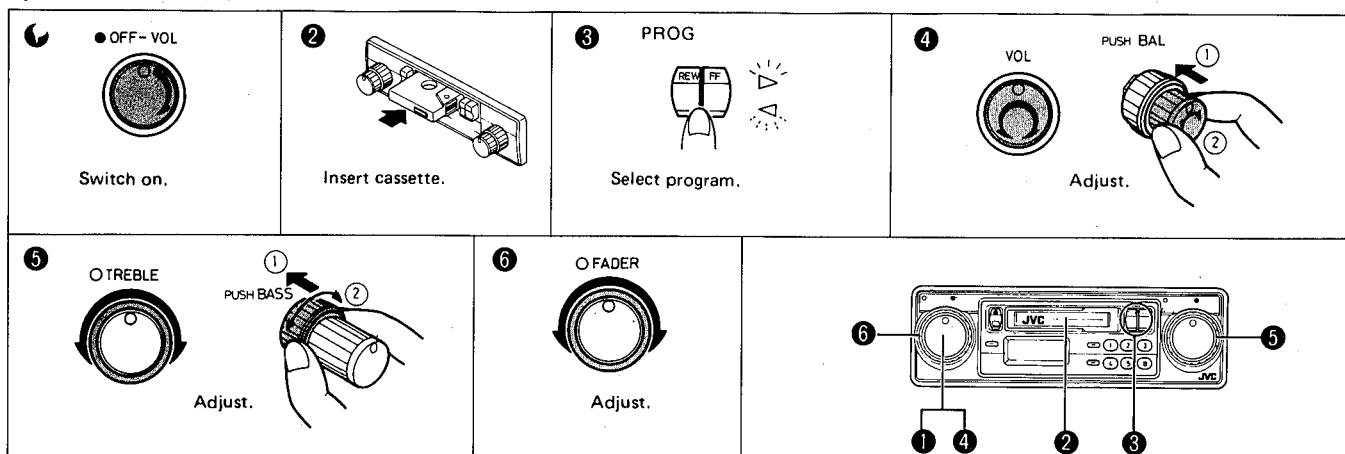

### PRESET SCAN BUTTON TUNING

This makes it possible to automatically scan preset FM and AM stations.

- ① Press the P.SCAN button.
- ② Scanning is performed in the order of preset stations in each frequency band (FM1, FM2, FM3 and AM). Each preset station is heard for approx. 5 seconds.
- ③ When the required station is heard and its frequency is flashing, press the P.SCAN button again.

## TAPE OPERATION

Operate in the order shown.

### AUTOMATIC LOUDNESS CONTROL

At low volumes, the human ear is less sensitive to high and low frequencies. This unit incorporates a circuit so that the low-volume sound at high and low frequencies is automatically boosted to output well-balanced sound.

### TO FAST FORWARD AND REWIND THE TAPE

Press the FF button to fast forward of the side being played back; when the end of tape is detected, the tape is reversed and played back from the beginning of the other side. Press the REW button to rewind the tape. When the tape is rewound to the beginning, it is played back again. Lightly press the other PROG button to start play from the current position during the fast forward or rewind mode.

### AUTO-REVERSE MECHANISM

When the tape reaches the end of one side, this mechanism automatically switches over to play back the other side. To listen to the other side while playing one side, press the PROG buttons. The change in the tape transport direction can be checked from the Tape Direction indicators.

**PRESET BUTTON TUNING**

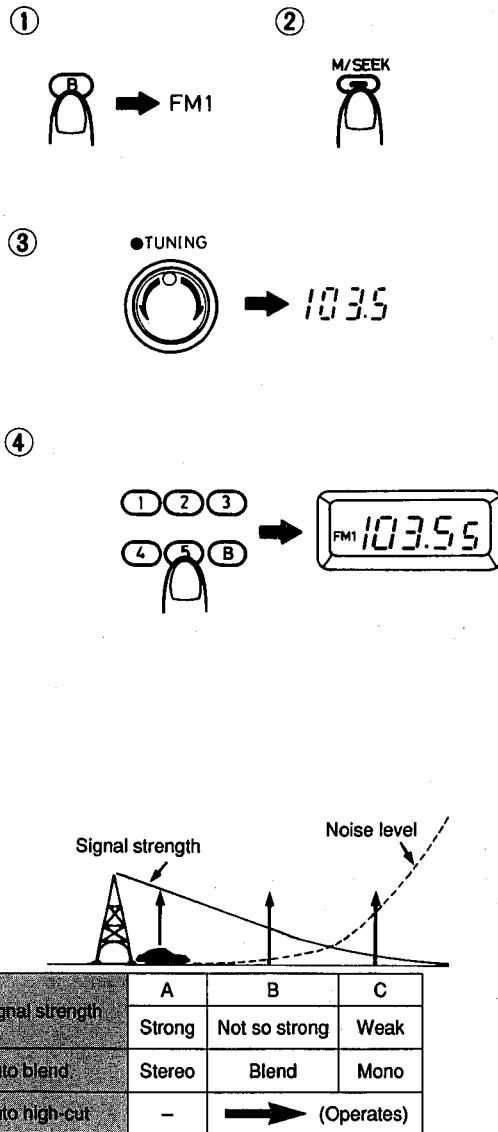

5 stations in each band (FM1, FM2, FM3 and AM) can be preset as follows;

- Example (when presetting Preset Station button "5" to FM station at 103.5 MHz)

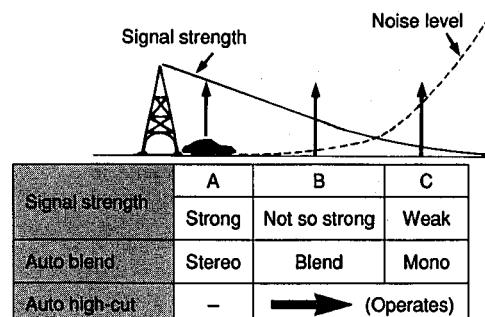

- ① Select the FM1 band using the B button.
- ② Set to the manual mode.
- ③ Tune to the desired station.
- ④ Press Preset Station button "5" for more than 2 sec. (When "5" flashes in the Preset Station display, the station is preset.)
- Repeat the above procedure for each of the other four stations using a different Preset Station button each time.
- Follow the above procedure for the other bands (FM2, FM3 and AM).

**Notes:**

- The preset station is erased when a station is newly preset because the new station is stored in the memory.
- The preset station is erased when the power supply to the memory circuit is interrupted during battery replacement, etc. When this occurs, preset the station again.

**(RADIO RECEPTION)****Automatic FM Noise Suppressor (AFNS)**

This unit incorporates an automatic FM noise suppression circuit to ensure satisfactory reception of FM broadcasts when a vehicle is moving and signal strengths are continuously fluctuating.

## INSTALLATION (IN-DASH MOUNTING)

### IMPORTANT

- Before using this unit for the first time, press the Eject button fully, to reset the mechanism.

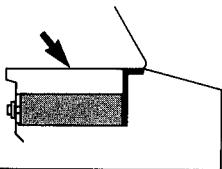

- The following illustration shows a typical installation. However, you should make adjustments corresponding to your specific car. If you have any questions or require information regarding installation kits, consult your JVC car audio dealer or a company supplying kits.

### Note:

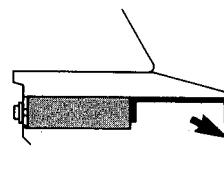

In some cases, it may be necessary to adjust the opening in the trim plate and/or dashboard, etc. to fit your car.

### • Examples for use of the back stay

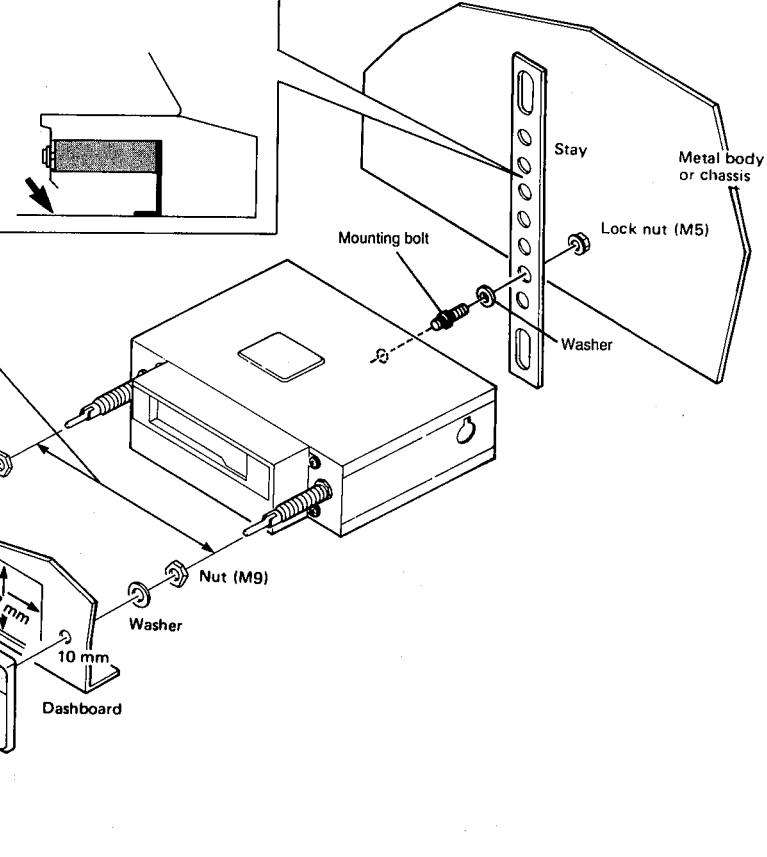

#### 1. Mount to instrument panel

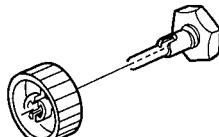

#### 2. Mount to fire wall

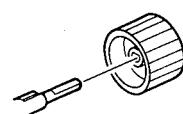

#### 3. Mount to floor board

### • Knob attachment

#### • Align both of the slots

#### • Align the flat parts

### • Make sure to assemble as shown, or the knobs will not fit.

## ELECTRICAL CONNECTIONS

To prevent short circuits, we recommend that you disconnect the battery's negative terminal and make all electrical connections before installing the unit. If you are not sure how to install this unit correctly, have it installed by a qualified technician.

### Note:

This unit is designed for a 12-volt DC negative ground. If your vehicle does not have this system, a voltage inverter is required, which can be purchased at JVC car audio dealers.

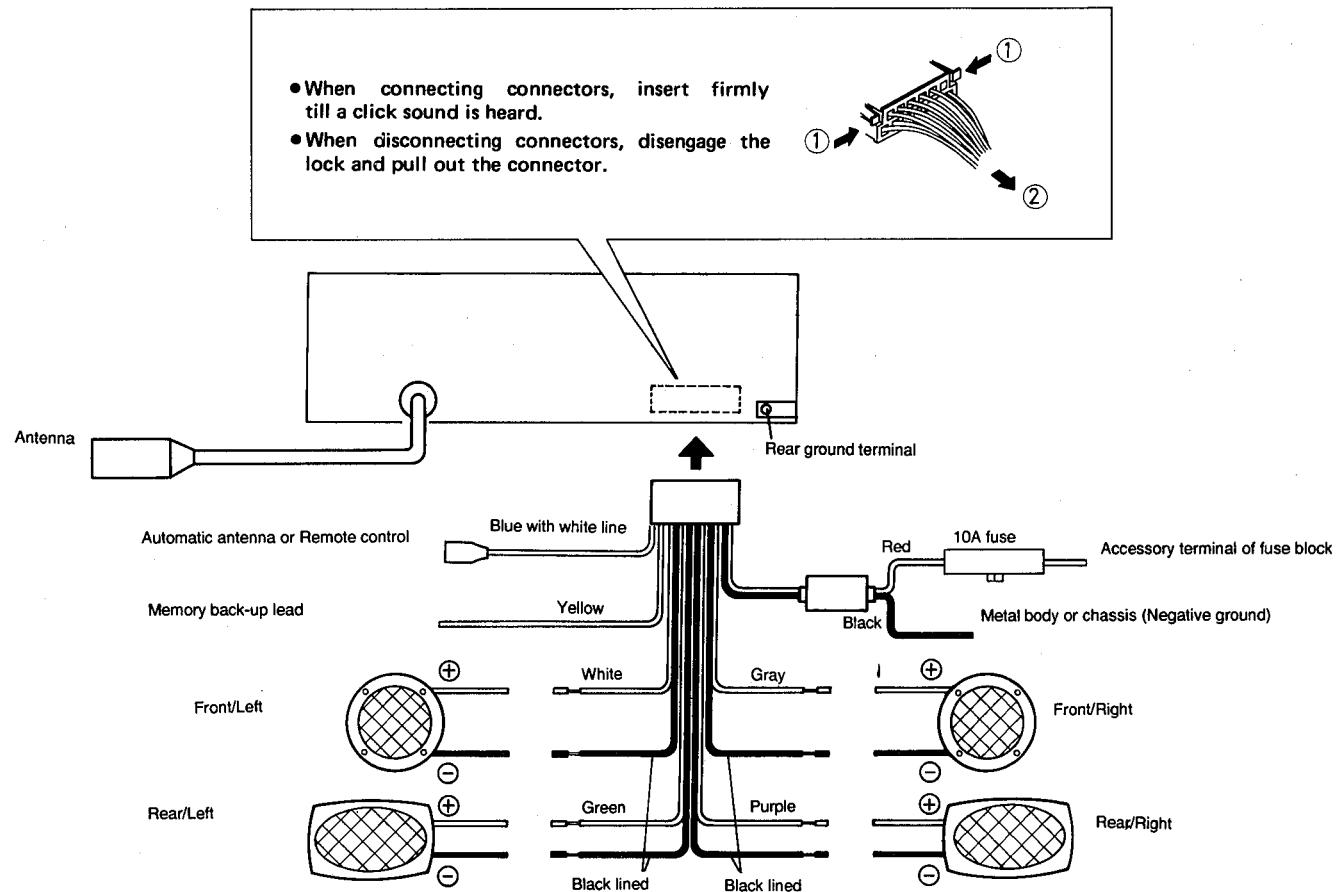

- Maximum input of the speakers should be more than 22 watts at the rear and 22 watts at the front, with an impedance of 4 to 8 ohms.

### CAUTIONS:

As this unit uses BTL (Balanced Transformerless) amplifier circuitry (floating ground system), please comply with the following:

1. Do NOT connect the black-lined speaker leads to a common point.
2. Do NOT connect the speaker leads to the metal body or chassis.
3. When NOT using the automatic antenna, cover the terminal with insulating tape to prevent the remote lead from shorting.
- Be sure to ground this unit to the car's chassis.

### A. 4-Speaker Connections

## B. 2-Speaker Connections

Two speakers can be connected to either the front or rear pair of speaker output terminals. Cover the unused terminals with insulating tape to prevent short-circuits.

## C. Automatic Antenna Connections

To use the automatic antenna, connect its remote lead (blue with white line) terminal. For details of installation, see the automatic antenna's Instruction Manual.

## D. Memory Back-Up Lead

Connect this lead to a LIVE power source (supplied even when vehicle ignition is OFF).

## E. Fader Control

- When used in a 4-speaker system

When the FADER control is turned counterclockwise, the sound will be heard from the front speakers, and when turned clockwise, from the rear speakers.

- When used in a 2-speaker system

Set this control to the center position.

## MAINTENANCE

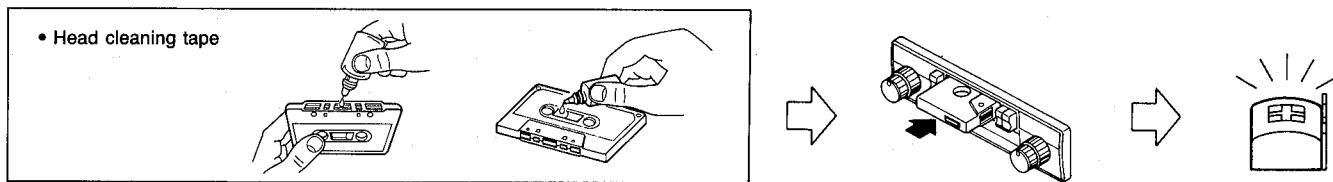

### • Cleaning The Head

Heads are important as they pick up sound. When they become dirty, the following symptoms become noticeable:

- The sound quality is reduced.
- The sound level is decreased.
- The sound can be heard intermittently.

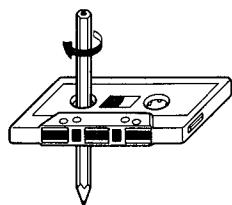

(Sound drop occurs.)

These are NOT malfunctions. However, before these symptoms appear, clean the heads after every 10 hours of use using a wet-type head cleaning tape, available from an audio store. For more details, refer to the Instructions of the Head Cleaning Tape.

## TAPE CARE HINTS

It is very important to keep your tapes clean. Always return them to their storage boxes after playback. Never store tapes in direct sunlight, high humidity or extremely hot temperatures. Never play dirty or dusty tapes — they can damage the head. Slack tape in a cassette can cause trouble by becoming entangled with the capstan or pinch roller.

### 3. Location of Main Parts

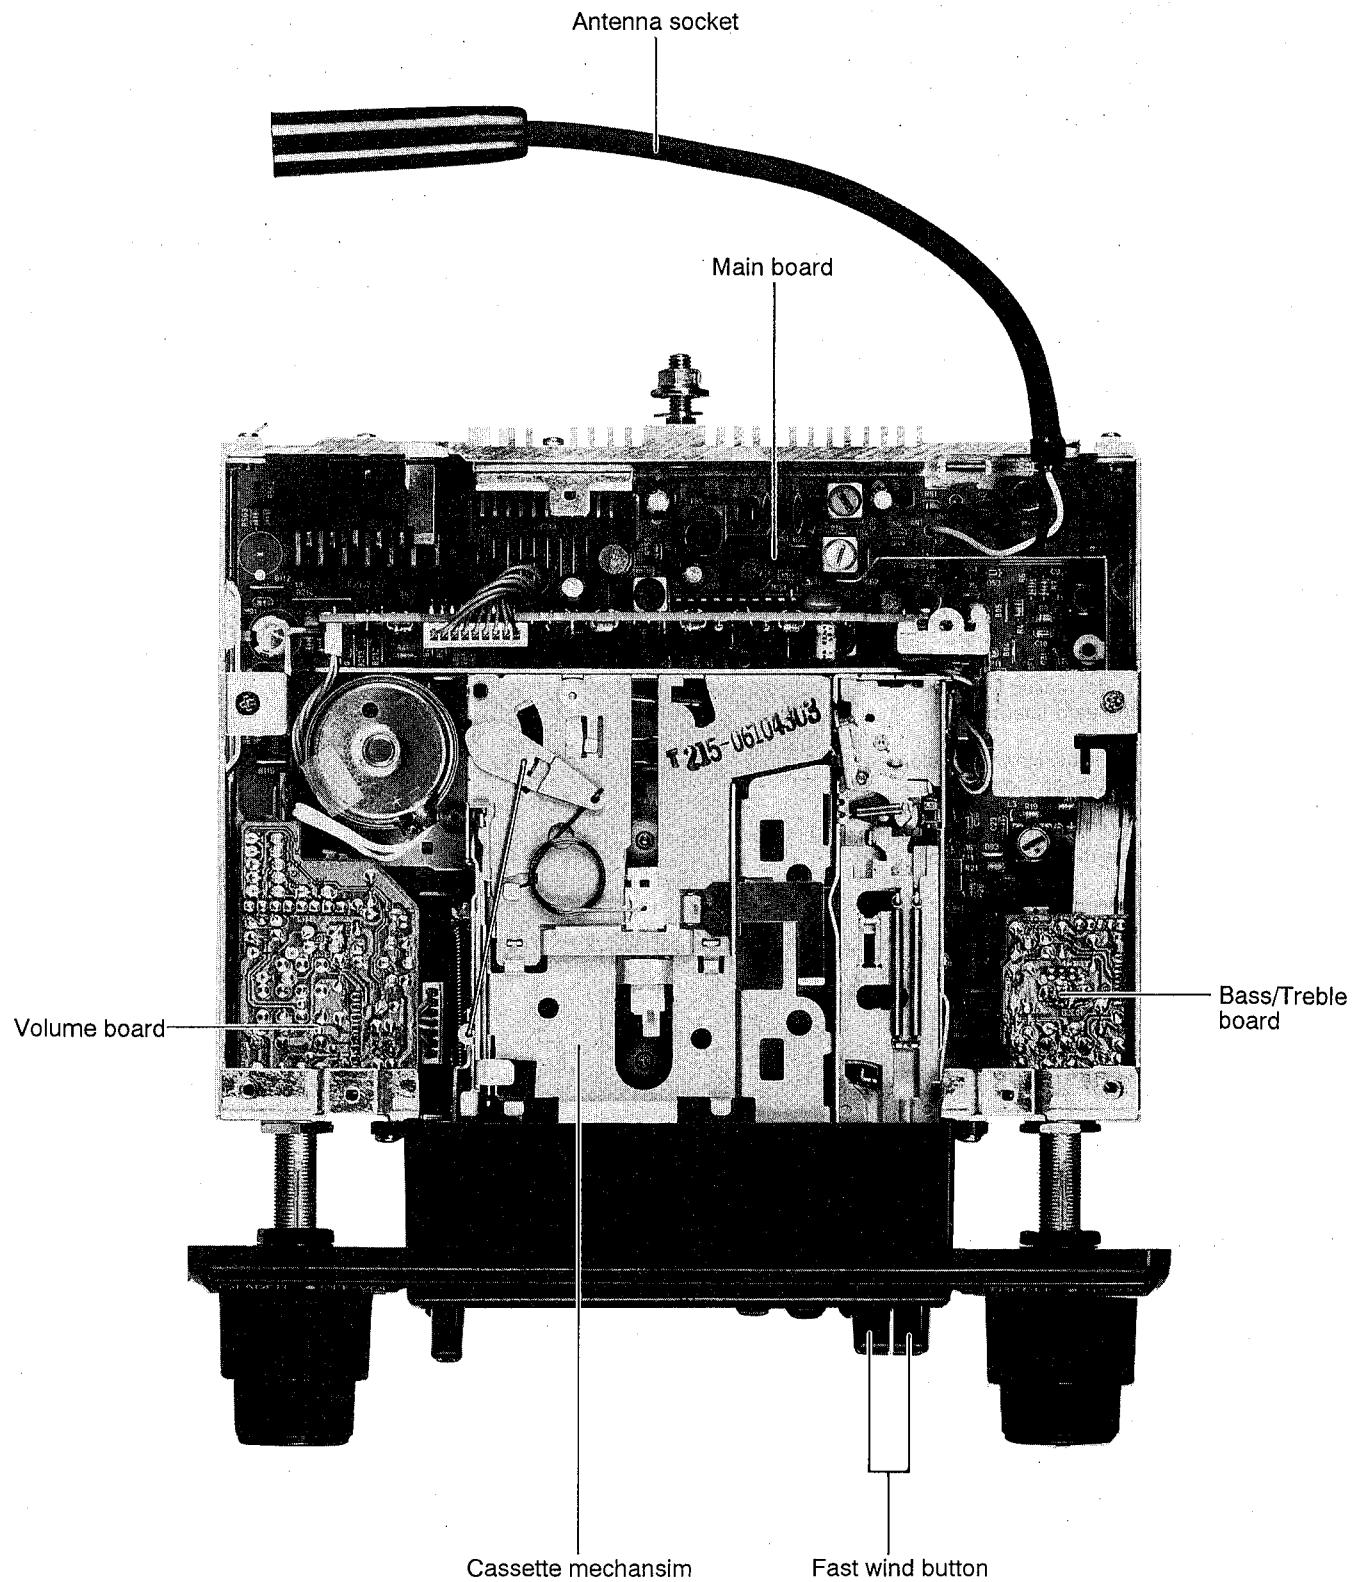

Fig. 3-1

## 4. Removal of Main Parts

### ■ Top cover (Figs. 4-1, 4-2, 4-3)

1. Remove three screws ([1] × 2, [2] × 1) retaining the top cover from the right top.
2. Remove two screws (3) retaining the top cover from the rear of the set.
3. Insert an ordinary screwdriver into a gap between the main body and the top cover while lifting the top cover upward to remove it.

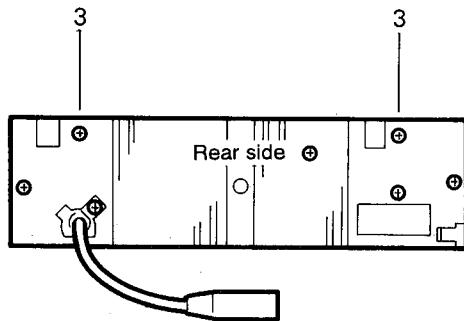

Fig. 4-2

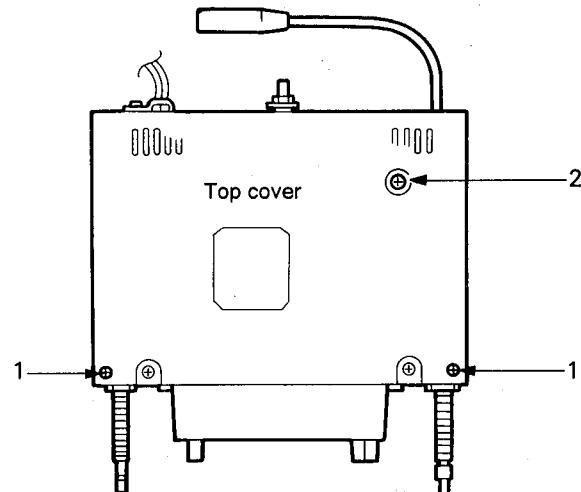

Fig. 4-1

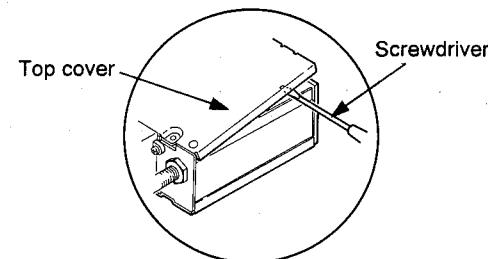

Fig. 4-3

### ■ Nosepiece assembly (Fig. 4-4)

- Remove four screws (4) retaining the nosepiece assembly from the front of the set.

### ■ Cassette mechanism assembly (Figs. 4-5, 4-6)

1. Remove the top cover. (Refer to the removal procedure of "Top cover" mentioned above.)
2. Remove two flat head screws (5) retaining the cassette mechanism assembly from the main body.
3. Disconnect a 5-pin connector cable originating from the head relay board from the connector on the pre-amp board.
4. Disconnect a 7-pin connector cable that is connected to the connector CJ701 on the main board from the connector on the mechanism switch board.
5. Place the set upside down, and remove two flat head screws (6) retaining the cassette mechanism assembly.

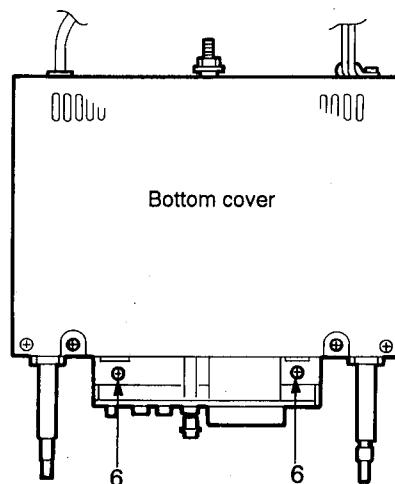

Fig. 4-6

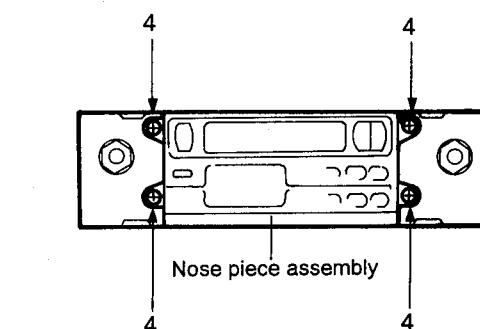

Fig. 4-4

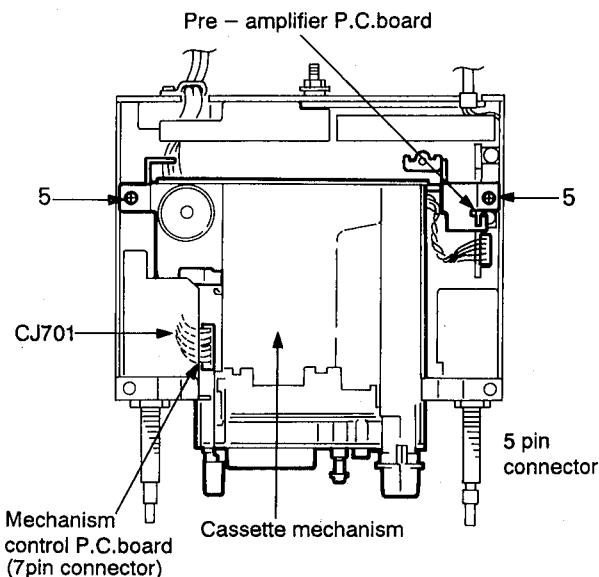

Fig. 4-5

### ■ Motor assembly and Belt (Fig. 4-7)

1. Place the cassette mechanism assembly upside down and hold the belt by a protrusion of the chassis to prevent it from getting soiled with oil, etc., and then remove two screws (7) retaining the motor assembly.
2. When re-engaging the belt for replacement, etc., make sure to engage it with the flywheels and the pulleys as shown in Fig. 4-7.

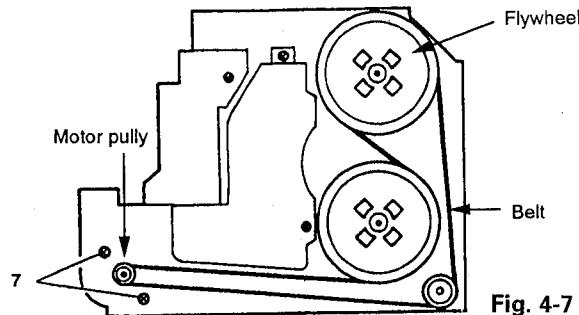

Fig. 4-7

### ■ FF/REW lever assembly (Figs. 4-8, 4-9)

1. Remove the cassette mechanism assembly. (Refer to the removal procedure of "Cassette mechanism assembly" mentioned above.)
2. Remove two screws (8) retaining the mechanism holder from the cassette mechanism assembly.
3. Remove one screw (9) retaining the FF/REW lever assembly from the cassette mechanism assembly. (See Fig. 4-9.)
4. Lift the FF/REW lever assembly in the arrow direction as shown in Fig. 4-9.
5. Disengage the tip of the FF/REW lever from the cutout portions of the chassis. (See Fig. 4-9.)

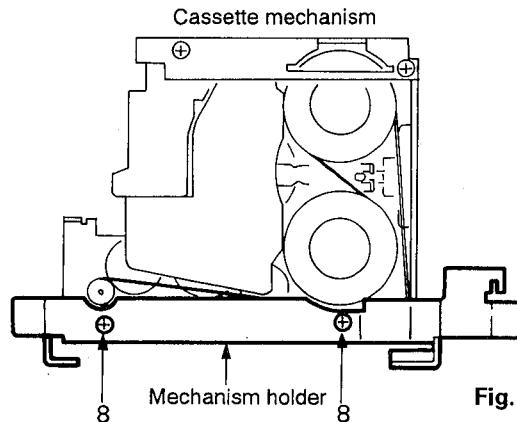

Fig. 4-8

### ■ PB head (Figs. 4-9, 4-10)

1. Remove the top cover. (Refer to the removal procedure of "Top cover" mentioned above.)
2. Remove the cassette mechanism assembly. (Refer to the removal procedure of "Cassette mechanism assembly" mentioned above.)
3. Remove the FF/REW lever assembly. (Refer to the removal procedure of "FF/REW lever assembly" mentioned above.)
4. Remove one screw (10) retaining the head relay board from the cassette mechanism assembly.
5. Remove two screws (11) retaining the PB head. When re-assembling, make sure to do it in the order from A, B, C to D and then to adjust the azimuth and height of the head.

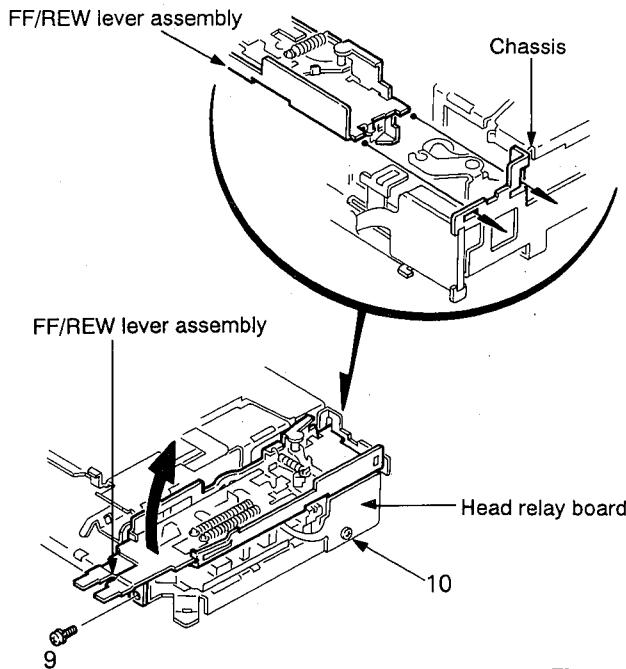

Fig. 4-9

### ■ Pinch roller assembly (Fig. 4-10)

1. Remove the top cover. (Refer to the removal procedure of "Top cover" mentioned above.)
2. Remove the cassette mechanism assembly. (Refer to the removal procedure of "Cassette mechanism assembly" mentioned above.)
3. Remove the FF/REW lever assembly. (Refer to the removal procedure of "FF/REW lever assembly" mentioned above.)
4. Remove nylon washers retaining the right and left pinch roller assemblies.

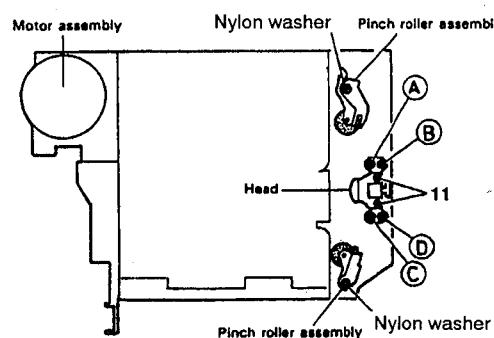

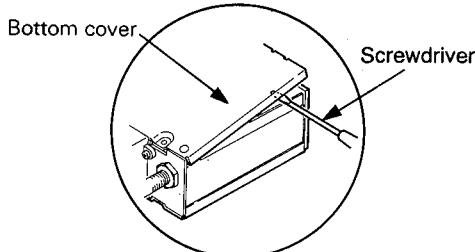

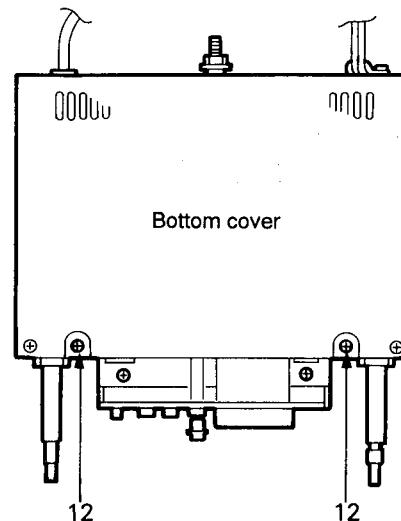

Fig. 4-10

■ **Bottom cover** (Figs. 4-11, 4-12, 4-13)

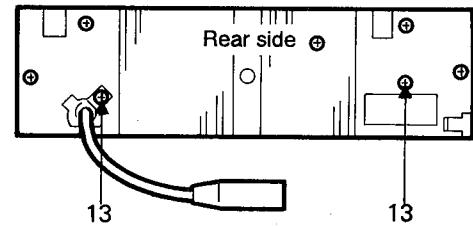

1. Place the set upside down, and remove two screws (12) retaining the bottom cover.
2. Place the set on its front side and remove two screws (13) retaining the bottom cover.
3. Remove the bottom cover in the same manner as for the top cover.

**Fig. 4-13**

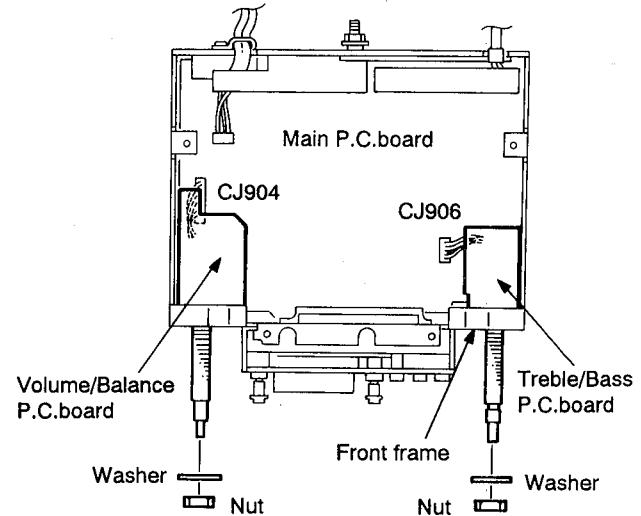

**Fig. 4-11**

**Fig. 4-12**

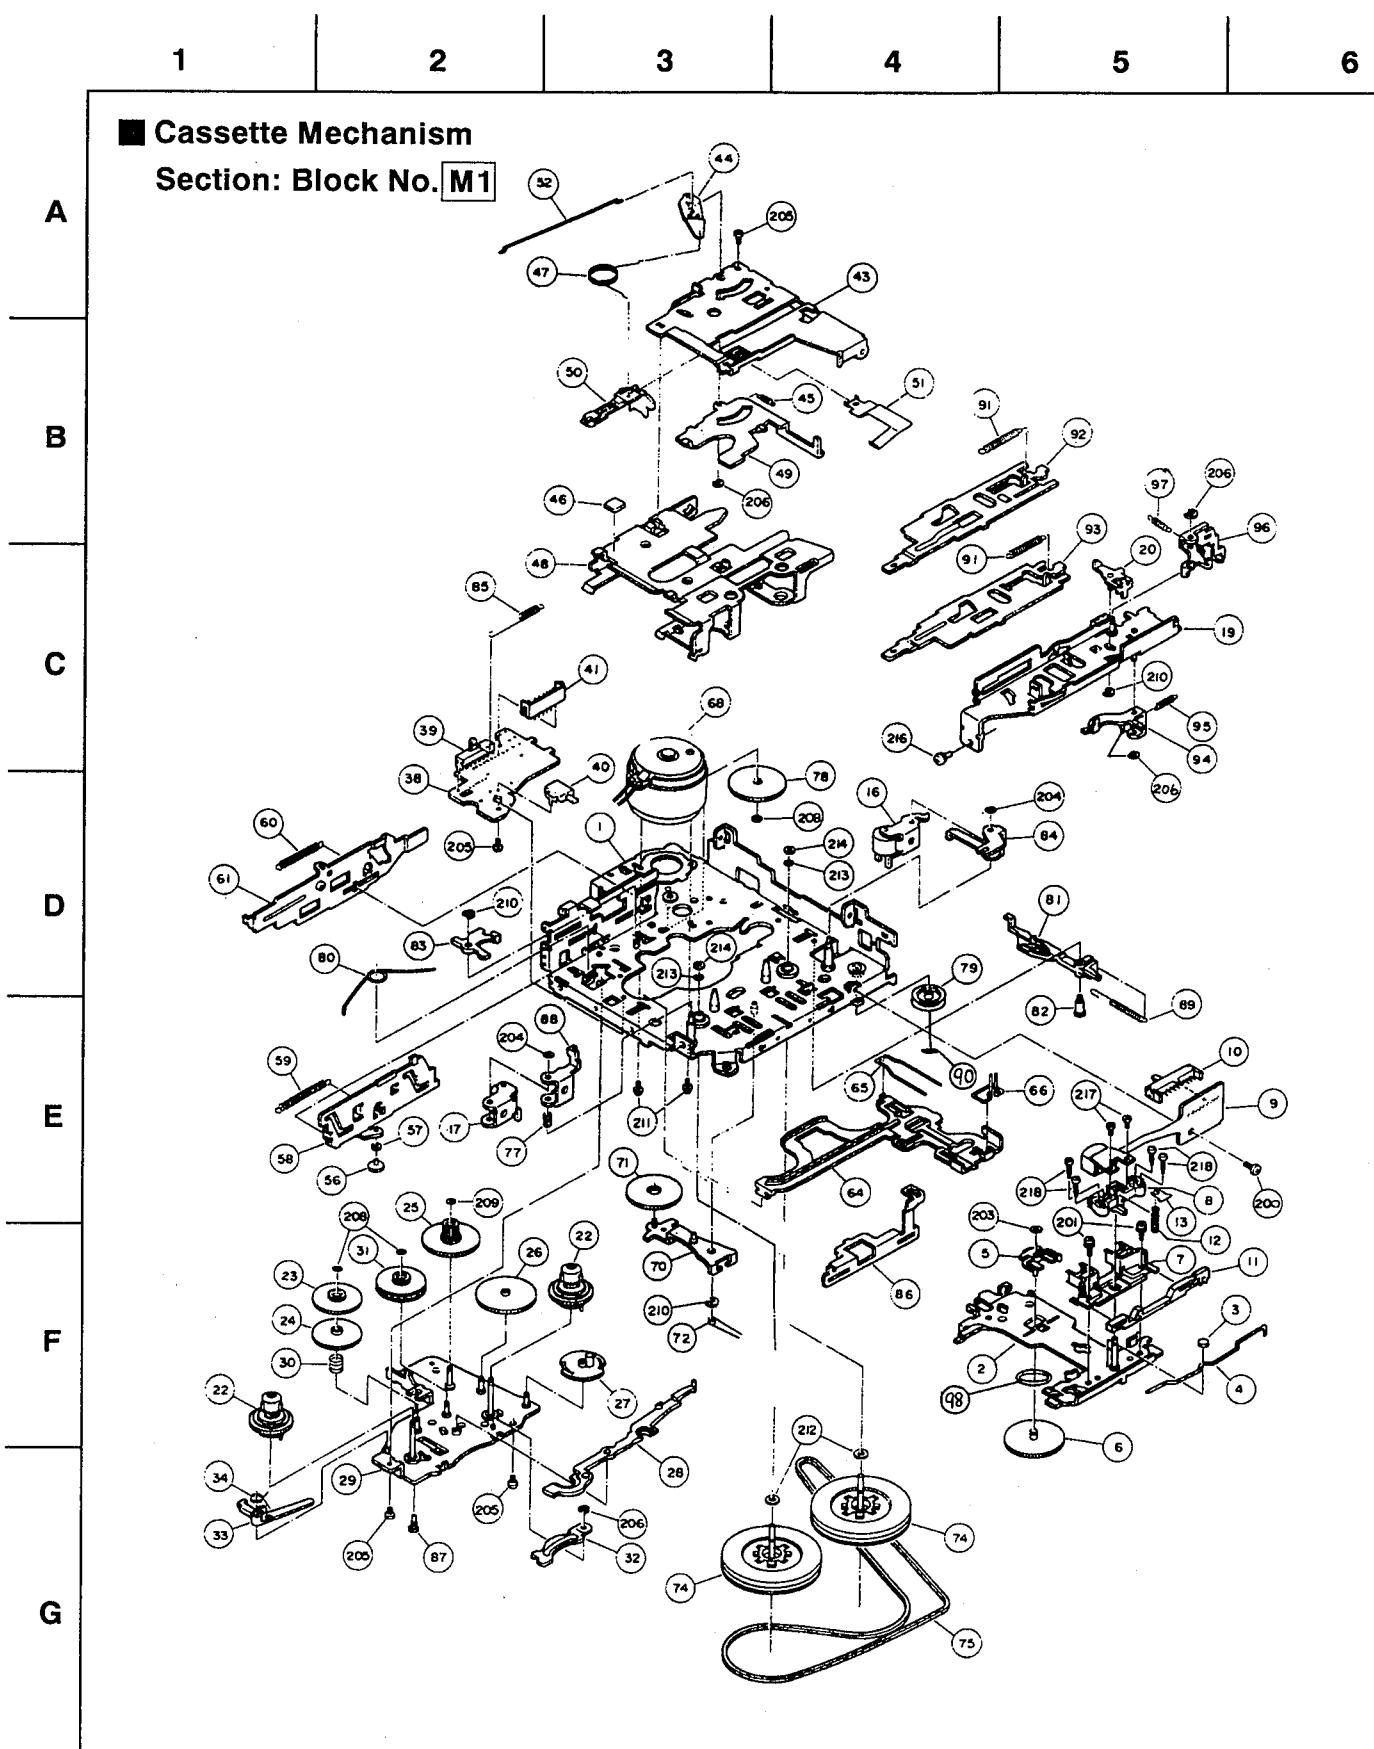

■ **Volume boards in both sides** (Fig. 4-14)

1. Remove the top cover. (Refer to the removal procedure of "Top cover" mentioned above.)
2. Facing the front of the set, remove the nut with washer retaining the volume/balance board.
3. Remove the volume shaft through the hole in the front frame.
4. Disconnect the connector CJ907 on the pre-amp board from the connector CN907 on the main amp board.
5. Remove the nut with washer retaining the treble/bass board.
6. Remove the volume shaft through the hole in the front frame.

BLOCK NO. M2MM

# 6. Main Adjustment

## ■ Equipment and measuring instruments used for adjustments

- Electronic voltmeter
- Audio frequency oscillator
- Attenuator (impedance 600 Ω)
- Wow-flutter meter
- Frequency counter
- Torque testing Cassette gauge  
TW-2111A (FWD PLAY)  
TW-2121A (REV PLAY)
- CTG-N (FF, REW)
- Mirror tape
- AM Standard Signal Generator
- FM Standard Signal Generator
- Alignment Tape  
VTT703L, VTT721, VTT712, VTT736
- EXT415-KIT: Extension Cord (Use for operation of Mechanism)

## ■ Condition for Measurement

Power Supply: DC 14.4 V  
(Reduced voltage 10.5 V)  
Load Impedance: Speaker 4 Ω  
(4 speakers Connection)  
(Line out 20 kΩ)

Loudness: OFF  
Balance: Indication "0"  
Bass/Treble: Indication "0"

## ■ Standard Volume Position

At standard condition for measurement, output level to be adjusted to 2.0 V with test tape VTT724 or TMT 7063MIX.

## ■ Tuner Section Adjustment

(The tuner pack is non-adjusting)

- Manual Tuning Up/Down Frequency

**FM** ..... 200 K Step

**AM** ..... 10 kHz Step

- Setting of Reference Frequency

**FM** ... 400 Hz, 22.5 kHz Deviation

**FM STEREO** ... 1 kHz, 67.5 kHz Deviation Pilot Signal 7.5 kHz

**AM** ... 400 Hz, 30% Modulation

**Output level** ... 0 dB = 1 μV, 50 Ω/Open terminal

## Dummy Loads

Exclusive dummy for AM, FM should be used. When FM dummy load is used, 6 dB loss occurs between SSG output and antenna input. It is not necessary to consider the 6 dB loss since direct reading figures are used in this working standard.

- Reference Output of SSG

**FM** ... 66 dBμV, at 97.9 MHz

**AM** ... 74 dBμV, at 1000 kHz

- Preset Memory of Initialize

Band	Preset Memory				
	M1	M2	M3	M4	M5
FM (MHz)	87.5	89.9	97.9	105.9	107.9
AM (kHz)	530	600	1000	1500	1710

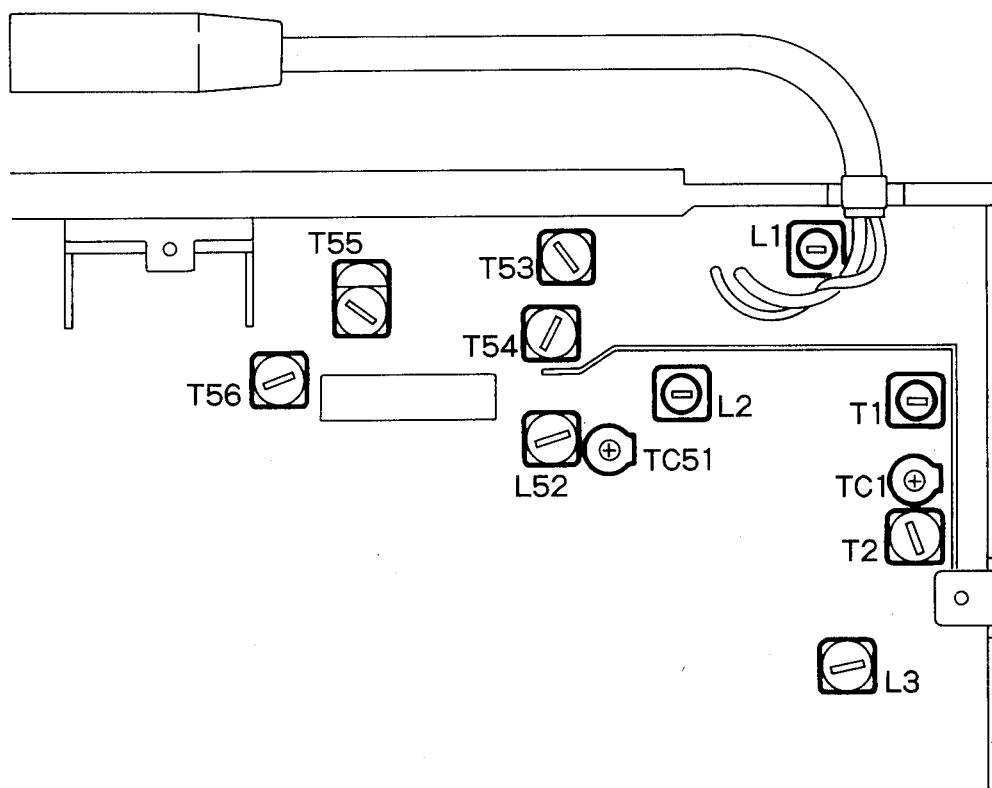

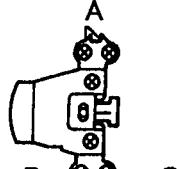

**■ Arrangement of Adjusting Positions**

Fig. 6-1

## Tape section adjustment

Item	Conditions	Adjustment and Confirmation methods	Stand.values	Adjust
1. Head Azimuth Adjustment	Test tape :VTT703L	<p>1. Basically, this mechanism do not require to align head azimuth. But, it need to be confirm during FA process.</p> <p>2. If the head azimuth is not aligned to the maximum or it is out of specification, adjustment will be necessary.</p> <p>3. Adjustment point</p> <p>① Screw A : It has been aligned by the supplier, so do not realign this screw.</p> <p>② Screw B : It will be aligned to the maximum when at forward play mode , but it must not be align when at reverse play mode.</p> <p>③ Screw C : It will be aligned to the maximum when at reverse play mode, but it must not be align when at forward play mode.</p> <p>4. Repeat adjustment ② and ③ until forward and reverse mode gains are both optimised.</p> <p>5. After alignment, no bonding is necessary to fasten the screws.</p>	Maximum	 <b>Fig. 6-2</b>
2.Tape speed and wow – flutter confirmation	Test tape VTT712 at near tape end.	<p>1. Check to see if the reading of the wow – flutter meter is within 3015 ~ 3045 Hz (FWD/REV), and less than 0.35% (JIS RMS).</p> <p>2. In case of out of specification, adjust the motor with a built – in volume resistor.</p>	Tape speed :3015 ~3045Hz Wow – flutter : 0.35% (JIS RMS)	Motor with a builtin volume resistor
3.Playback frequency response confirmation	Test tape VTT724, VTT736	<p>1. Play test tape VTT724, the set the volume position at 2V.</p> <p>2. Play test tape VTT736 through BPF 1kHz,125Hz and 12.5kHz or test tape VTT736.</p> <p>3. Loudness effect should be checked at below standard volume position.</p>	Speaker out 1k/125Hz :4 ± 3dB 1k/8kHz :0 ± 3dB	
4.Maximum output power confirmation	Test tape :VTT721 Volume& Tone :maximum	<p>1. Confirm both the front and rear output to be more than 5.3V.</p> <p>2. Confirm that consumption current at above condition to be less than 5A.</p> <p>3. Sound leakage should not occur at volume minimum.</p> <p>4. Oscillation should not occur at BASS/TREBLE at minimum.</p>	Output level : more than 5.3V Consumption current : less than 5A	

Item	Conditions	Adjustment and Confirmation methods	Stand.values	Adjust
5. Playback noise	Empty tape	1.Noise level to be less than 3mV at volume minimum. 2.Current consumption to be less than 0.7A at above condition.	Less than 3mV Less than 0.7A	
6.BASS/TREBLE	FM 97.9MHz,60dB μ ,22.5kHz dev.with center click,pre – emphasis 75 μ s.		100 Hz : ± 7~13dB (variable) 10kHz : ± 7~13dB (variable)	

### ■ Tuner section adjustment

Item	Conditions	Adjustment and Confirmation methods	Stand.values	Adjust
1.AM voltage adjustment	Test point:TP51 Measuring :AM 530kHz : AM 1710kHz		1.2 ± 0.02V 8.0 ± 0.1V	L52 TC51
2.AM antenna adjustment	AM 600 kHz weak signal  AM 1500 kHz weak signal	Note : Repeat until tracking at 600 kHz and 1500 kHz are both optimized. Voltage at 1710 kHz should be below 8.5V.	Output maximum Output maximum	In sequence T53,T54 repeatedly until O/P is maximum TC51
3.AM IF adjustment	AM 600kHz weak signal		Output maximum	TC55, T56
4.S/N sensitivity confirmation	AM 1000kHz,34dB μ	Output difference level between modulation ON/OFF to be more than 20 dB.	more than 20dB	
5.Radio/Tape level difference confirmation	AM 1000kHz,1kHz,30% modulation,74dB μ	Against VTT724, the output difference level to be within – 4 to – 10dB.	within – 4 to – 10dB	
6.Auto stop sensitivity confirmation	AM 1000kHz, 26 to 40 dB	1.Start seek and then stop within the above condition. 2.Not to stop lower than minimum mentioned sensitivity.		

Item	Conditions	Adjustment and Confirmation methods	Stand.values	Adjust
1.FM voltage adjustment	Test point :TP11 FM 107.9MHz		$7.8 \pm 0.05V$	L2
2.FM 0V adjustment	Test point:TP1 FM 97.9MHz, 66dB non modulation		$0 \pm 0.01V$	L3
3.FM antenna adjustment	FM 107.9MHz weak signal	Note:Repeat adjustment until tracking at 107.9MHz and 87.5MHz are both optimised. Align frequency 107.9MHz first. If core is out more than 1mm from bobbin, put wax on the core.	Output maximum	TC1
	FM 87.5MHz weak signal			L1, T1
4.FM IF adjustment	FM 97.9MHz weak signal		Output maximum	T2
5.FM S/N sensitivity	97.9MHz ,22dB $\mu$	Output difference level between modulation ON & OFF to be more than 30 dB.	more than 30 dB	
6.FM stereo indication sensitivity	97.9MHz, 1kHz , 67.5kHz dev.,pilot 7.5kHz dev.	1.When input is 22 dB $\mu$ , " ST " indication appears. 2.When input is 0 dB $\mu$ , " ST " indication disappears.		
7.FM stereo separation	97.9MHz, 1kHz, 67.5kHz dev.	1.Separation to be more than 24dB. 2.The left / right difference to be within 3 dB.	more than 24dB	
8.FM S/N ratio	97.9MHz,66dB $\mu$	Output difference level between modulation ON/OFF to be more than 50dB.	more than 50dB	
9.Radio/Tape level difference	1kHz,22.5kHz dev.,66dB $\mu$	Against test tape VTT724, the output difference level to be within – 4 to – 10dB.	within – 4 to – 10dB	
10.FM muting	Apply standard signal at 97.9MHz, 66dB $\mu$ . Then reduce the output of SSG from 66dB to – 19dB.	Output difference level to be 8 to 25 dB.	8 to 25 dB	
11.Auto stop sensitivity	97.9MHz,22 to 36 dB $\mu$	1.Start seek and then stop within the above sensitivity. 2.Not to stop lower than minimum mentioned sensitivity		
12.Clock adjustment	Test point :TP701 or B1 AM 1710 kHz	Note:1. Clock adjustment to be done after aligning tuner(To get higher accuracy ). 2. High impredece can not to be use.	$2160 \pm 0.005\text{kHz}$	TC701
13.Clock frequency check		Check the clock frequency to be within $\pm 15\text{Hz}$ at FA.	within $\pm 15\text{kHz}$ at FA

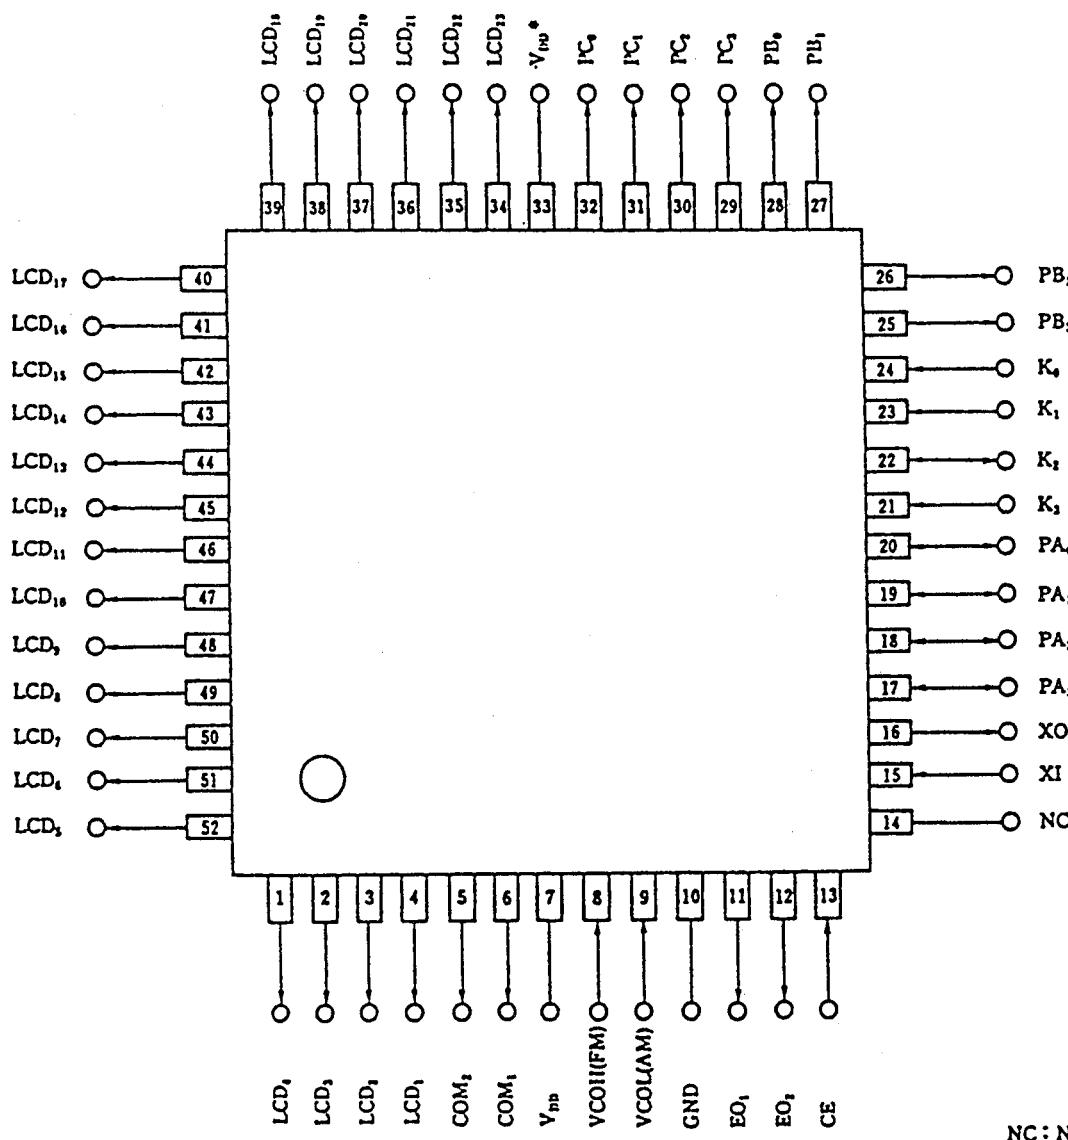

Fig. 10-1 (Top View)

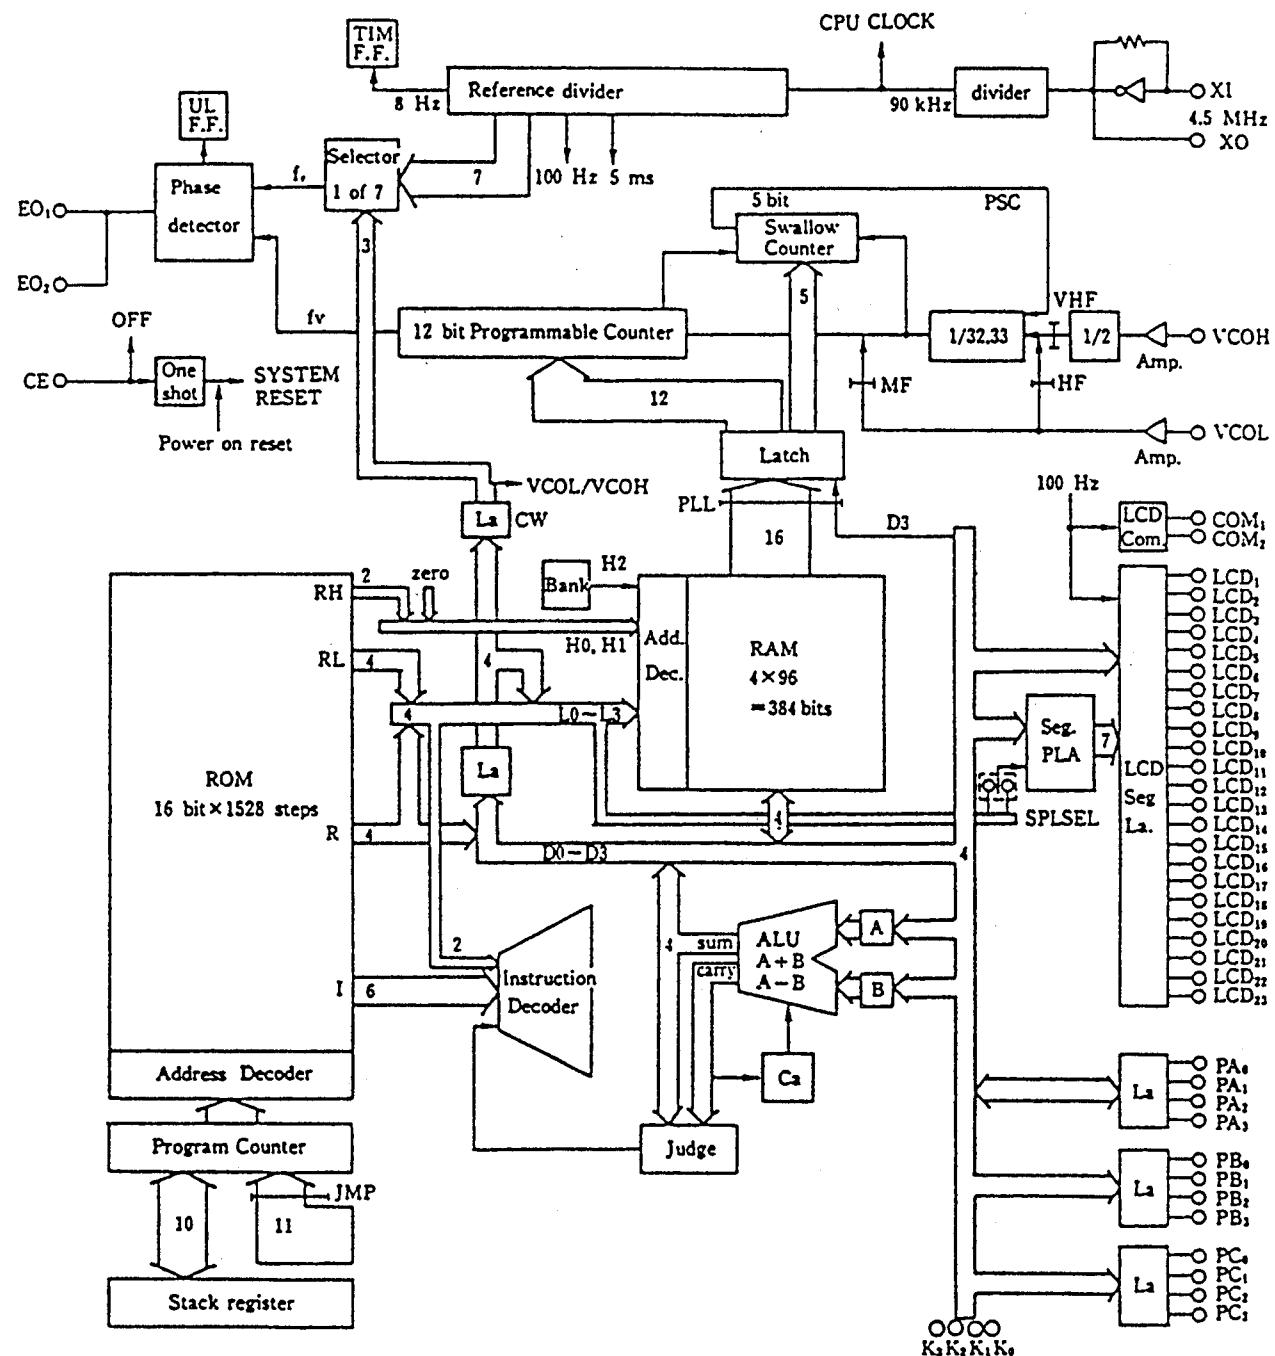

Fig. 10-2

## ■ IC701 MPD1708AG - 898

Terminal No.	Symbol	Designation	Description	Output form
34~52 1~4	LCD <sub>23</sub> LCD <sub>5</sub> LCD <sub>4</sub> LCD <sub>1</sub>	LCD Segment Outputs	<p>These are segment signal output terminals to the LCD panel. 46 dots can be displayed in maximum based on the matrixes with COM<sub>1</sub> and COM<sub>2</sub>. By executing LCDD command, signals will be output to these terminals. The contents of optional address memory in the data memory (RAM) specified by the first operand section of LCDD command will be output to a digit of LCD matrix specified by the second operand section.</p> <p>When an even number of digit is specified at this time, the contents of data memory specified by the first operand section will be output to these terminals through a segment PLA (programmable logic array). 32 kinds of patterns can be generated by the segment PLA.</p> <p><b>Note:</b> During power supply making (<math>V_{DD} = \text{Low} \rightarrow \text{High}</math>) and execution of CKSTP command, the "Low" level (display OFF mode) will be output automatically.</p>	COMS push-pull
5, 6	COM <sub>2</sub> COM <sub>1</sub>	LCD Common Output	<p>These are common signal output terminals to the LCD panel. 46 dots can be displayed in maximum based on the matrixes with LCD1~LCD23.</p> <p>Three values of GND, <math>1/2V_{DD}</math> and <math>V_{DD}</math> (5 msec. interval) will be output at a period of 50 Hz. The segment wherein a potential difference of <math>\pm V_{DD}</math> has occurred between these terminals and LCD<sub>1</sub>~LCD<sub>23</sub> will be turned on.</p> <p><b>Note:</b> During power supply making (<math>V_{DD} = \text{Low-High}</math>) and execution of CKSTP command, the "Low" level (display OFF mode) will be output automatically.</p>	COMS push-pull
7, 33	V <sub>DD</sub>	Power Supply	<p>This is a power supply terminal to the device. When the device is in action, 5 V <math>\pm 10\%</math> will be supplied to it. When storing internal data memory (RAM) (during execution of CKSTP command), the voltage can be lowered to 2.5 V.</p> <p>When 0 <math>\rightarrow</math> 4.5 V has been supplied to this terminal, the device will be reset and the program be started from "0" address.</p> <p><b>Note:</b> Since 7 PIN and 33 PIN are connected inside chips, there is no need to supply any voltage to both of the pins. When voltage is supplied to one of the pins, both of them will act. However, be careful since the 33 PIN is not connected in the case of the ES parts (ceramic package).</p>	
8	VCOH (FM)	Local Oscillation Signal Input	<p>This is a local oscillation output (VCO output) terminal from 10 to 150 MHz (0.5 V<sub>p-p</sub> min.). Provided in this terminal are 1/2 fixed division prescaler, 1/32 and 1/33 two modulus division prescalers. Therefore, it is necessary to determine the division value of programmable divider from half the frequency of the local oscillator output (VCO output).</p> <p>When the HF command has been executed based on the direct division and pulse swallow systems, namely, when the VCOL terminal has been selected, then the VCOH terminal will be placed automatically into "pull-down" state (GND).</p> <p>Since an AC amplifier is built in, the input should be made after condenser cutting.</p>	Input

Terminal No.	Symbol	Designation	Description	Output form												
9	VCOL (AM)	Local Oscillation Signal Input	<p>A local oscillation input (VCO output) from 0.6 to 60 MHz (0.3 V<sub>p-p</sub> MIN.) will be input to this terminal.</p> <p>This terminal will be selected and become active when the HF command has been executed based on the direct division and pulse swallow systems. However, be careful since the upper limit of frequency and lower limit of division ratio which can be input vary between the above two division systems.</p> <table border="1"> <thead> <tr> <th>Division system</th><th>Input voltage (min.)</th><th>Input frequency</th><th>Division ratio</th></tr> </thead> <tbody> <tr> <td>Direct division</td><td>0.1 V<sub>p-p</sub></td><td>0.59 ~ 20 MHz</td><td>16 ~ (2<sup>12</sup> - 1)</td></tr> <tr> <td>Pulse swallow (HF command execution)</td><td>0.1 V<sub>p-p</sub> 0.3 V<sub>p-p</sub></td><td>0.6 ~ 40 MHz 0.6 ~ 50 MHz</td><td>1024 ~ (2<sup>12</sup> - 1)</td></tr> </tbody> </table> <p>When the VHF command has been selected based on the pulse swallow system, namely, when the VCOH terminal has been selected, then the VCOL terminal will be placed automatically into pull-down state (GND).</p> <p>Since an AC amplifier is built in, the input should be made after condenser cutting.</p>	Division system	Input voltage (min.)	Input frequency	Division ratio	Direct division	0.1 V <sub>p-p</sub>	0.59 ~ 20 MHz	16 ~ (2 <sup>12</sup> - 1)	Pulse swallow (HF command execution)	0.1 V <sub>p-p</sub> 0.3 V <sub>p-p</sub>	0.6 ~ 40 MHz 0.6 ~ 50 MHz	1024 ~ (2 <sup>12</sup> - 1)	Input
Division system	Input voltage (min.)	Input frequency	Division ratio													
Direct division	0.1 V <sub>p-p</sub>	0.59 ~ 20 MHz	16 ~ (2 <sup>12</sup> - 1)													
Pulse swallow (HF command execution)	0.1 V <sub>p-p</sub> 0.3 V <sub>p-p</sub>	0.6 ~ 40 MHz 0.6 ~ 50 MHz	1024 ~ (2 <sup>12</sup> - 1)													
10	GND	Ground	This is a ground terminal of the device.													
11, 12	EO <sub>1</sub> , EO <sub>2</sub>	Error Outputs	<p>These are PLL error output terminals. When the divided local oscillation frequency (VCO output) is higher or lower than the reference frequency, the "High" or "Low" level will be output from these terminals. When the frequency complies with the reference frequency, the terminals will be floating.</p> <p>These error outputs will be input to the external LPF (low pass filter) and applied to varactor diode through the LPF. Meanwhile, since EO<sub>1</sub> and EO<sub>2</sub> are output in a same waveform, either of the terminals can be selected optionally.</p>	COMS 3 states												
13	CE	Chip Enable	<p>This is a device selection signal input terminal. Set this terminal to "High" level to let the device perform normal action and to "Low" level when the device is not used. While this terminal is kept at "Low" level, the PLL will be under Disable state. However, 134 μsec. or shorter input will not be accepted.</p> <p>In case the CKSTP command has been executed when the CKSTP command is being used in program and the CE terminal is at "Low" level (The SKSTP command is effective only where "CE = Low", and acts similarly as in the case of NOP command where "CE = Low"), then the internal clock generator and CPU will be placed into standstill, and the memory can be protected at low consumption current (10 μA or less). At this time, the display outputs (LCD<sub>1</sub> ~ LCD<sub>28</sub> and COM<sub>1</sub> ~ COM<sub>2</sub>) will be placed automatically into display OFF mode ("Low level").</p> <p>Input</p> <p>When the CE terminal has been selected from "Low" level to "High" level, the device will be reset and the program start from "0" address.</p> <p>At this time, moreover, the I/O port (Port A) will be set to the input mode.</p>	input												

Terminal No.	Symbol	Designation	Description	Output form
14	NC	No-Connection	It is impossible to use this terminal since it is not connected to an internal chip. However, there will be no problem if this terminal is connected freely to OPEN, GND, V <sub>DD</sub> and so forth.	
15, 16	XI XO	X'tal	This is a crystal oscillator connection terminal, and used for connecting 4.5 MHz crystal. The oscillation frequency (4.5 MHz) should be adjusted while observing the XO terminal.	Input CMOS
17~20	PA <sub>3</sub> & PA <sub>0</sub>	Port A	This port is a 4 bit L/O (input/output) port. With this port, it is possible to specify input and output every 1 bit according to the contents of 1FM address in data memory (RAM) called "PAIO" word (Refer to Notes 1 and 2).	CMOS push-pull
21~24	K <sub>3</sub> & K <sub>0</sub>	Key Return Signal Inputs	This are a 4 bit input port and used normally as a key matrix input port. When the KIN or KI command has been executed, the status of this terminal will be read in the data memory (RAM) specified by the corresponding operand section.  Meanwhile, this is of such a special configuration as to enable use of higher 2 bits (PC <sub>3</sub> and PC <sub>2</sub> ) of Ports B and C as key return signal sources.	Input
25~28	PB <sub>3</sub> & PB <sub>0</sub>	Port B	This is a 4 bit output port, and used as a port for key return signal source of key matrix since the sink current is made smaller particularly in view of its configuration.  In other words, when this port is used as a key return signal source, the external diode can be omitted. In case this port is used as a normal output port, the sink current will become too small depending on the driving circuit. Therefore, a correct low level would not be output in some cases. In such a case, connect the pull-down resistor to this port (Refer to Notes 1 and 3).	CMOS push-pull
29~32	PC <sub>3</sub> & PC <sub>0</sub>	Port C	This is a 4 bit output port. The absorption current in PC <sub>3</sub> and PC <sub>2</sub> among 4 bits is made particularly small in view of configuration similarly as in the case of Port B above. Therefore, this port is used as a key return signal source of key matrix (Refer to Notes 1 and 3).	CMOS push-pull

**Note 1.** In the port control commands (IN, OUT, SPB, RPB and other commands), PA<sub>1</sub> and PA<sub>2</sub> correspond respectively to the lowest and highest bits of resistor or operand data, and so in the case of Ports B and C.

**Note 2.** When the device has been reset (V<sub>DD</sub> = Low → High and CE = Low → High) and when the CKSTP command has been executed, then the Port A (I/O port) will be set to input mode.

**Note 3.** Since instable data will be output to the special output ports (Ports B and C) during power supply making (V<sub>DD</sub> = Low → High), it is necessary to initialize the ports with program. Moreover, when the CE terminal is "Low" → "High" and during execution of the CKSTP command, the contents of the output data will not be changed from those of the previous data. In this case, therefore, it is necessary to initialize the ports with program as required
