1. INTRODUCTION

42" Plasma TV is a progressive TV control system with built-in **de-interlacer** and **scaler**. It uses a 852*480 panel with 16:9 aspect ratio. The TV is capable of operation in PAL, SECAM, NTSC (playback) colour standards and multiple transmission standards as B/G, D/K, I/I', and L/L' including German and NICAM stereo. Sound system output is supplying 2x10W (10%THD) for stereo 8 Ω speakers. The chassis is equipped with many inputs and outputs allowing it to be used as a center of a media system.

It supports following peripherals:

- 2 SCART sockets
- 1 AV input (CVBS+ Stereo Audio)
- 1 SVHS input
- 1 Stereo Headphone output
- 1 D-Sub 15 PC input
- 1 DVI input
- 1 Stereo audio input for PC/DVI
- 1 Stereo audio output

2. TUNER

The tuners used in the design are combined VHF, UHF tuners suitable for CCIR systems B/G, H, L, L', I/I', and D/K. The tuning is available through the digitally controlled I²C bus (PLL). Below you will find info on one of the Tuners in use.

General description of UV1316:

The UV1316 tuner belongs to the UV 1300 family of tuners, which are designed to meet a wide range of applications. It is a combined VHF, UHF tuner suitable for CCIR systems B/G, H, L, L', I and I'. The low IF output impedance has been designed for direct drive of a wide variety of SAW filters with sufficient suppression of triple transient.

Features of UV1316:

- 1. Member of the UV1300 family small sized UHF/VHF tuners
- 2. Systems CCIR: B/G, H, L, L', I and I'; OIRT: D/K
- 3. Digitally controlled (PLL) tuning via I²C-bus
- 4. Off-air channels, S-cable channels and Hyperband
- 5. World standardised mechanical dimensions and world standard pinning
- 6. Compact size
- 7. Complies to "CENELEC EN55020" and "EN55013"

Pinning:

1. Gain control voltage (AGC) : 4.0V, Max: 4.5V

Tuning voltage

3. I²C-bus address select : Max: 5.5V

4. I²C-bus serial clock
5. I²C-bus serial data
6. Min:-0.3V, Max: 5.5V
7. Min:-0.3V, Max: 5.5V

6. Not connected

7. PLL supply voltage : 5.0V, Min: 4.75V, Max: 5.5V

8. ADC input

9. Tuner supply voltage : 33V, Min: 30V, Max: 35V

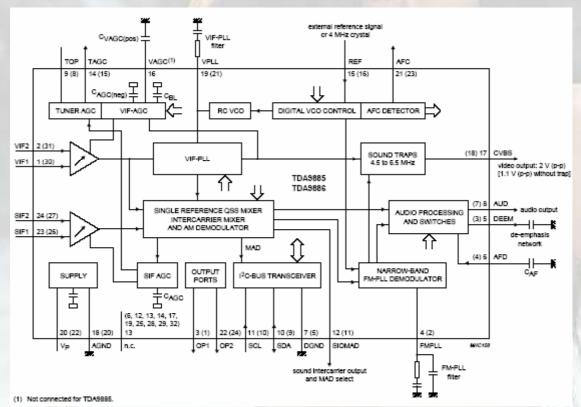

10. Symmetrical IF output 111. Symmetrical IF output 2

3. IF PART (TDA9886)

The TDA9886 is an alignment-free multistandard (PAL, SECAM and NTSC) vision and sound IF signal PLL. The following figure shows the simplified block diagram of the integrated circuit.

The integrated circuit comprises the following functional blocks:

VIF amplifier, Tuner and VIF-AGC, VIF-AGC detector, Frequency Phase-Locked Loop (FPLL) detector, VCO and divider, Digital acquisition help and AFC, Video demodulator and amplifier, Sound carrier trap, SIF amplifier, SIF-AGC detector, Single reference QSS mixer, AM demodulator, FM demodulator and acquisition help, Audio amplifier and mute time constant, I²C-bus transceivers and MAD (module address), Internal voltage stabilizer.

4. MULTI STANDARD SOUND PROCESSOR

The MSP34x0G family of single-chip Multistandard Sound Processors covers the sound processing of all analogue TV-Standards worldwide, as well as the NICAM digital sound standards. The full TV sound processing, starting with analogue sound IF signal-in, down to processed analogue AF-out, is performed on a single chip.

These TV sound processing ICs include versions for processing the multichannel television sound (MTS) signal conforming to the standard recommended by the Broadcast Television Systems Committee (BTSC). The DBX noise reduction, or alternatively, Micronas Noise Reduction (MNR) is performed alignment free. Other processed standards are the Japanese FM-FM multiplex standard (EIA-J) and the FM Stereo Radio standard.

Current ICs have to perform adjustment procedures in order to achieve good stereo separation for BTSC and EIA-J. The MSP 34x1G has optimum stereo performance without any adjustments.

5. VIDEO SWITCH TEA6415

In case of three or more external sources are used, the video switch IC TEA6415 is used. The main function of this device is to switch 8 video-input sources on the 6 outputs.

Each output can be switched on only one of each input. On each input an alignment of the lowest level of the signal is made (bottom of sync. top for CVBS or black level for RGB signals).

Each nominal gain between any input and output is 6.5dB.For D2MAC or Chroma signal the alignment is switched off by forcing, with an external resistor bridge, 5VDC on the input. Each input can be used as a normal input or as a MAC or Chroma input (with external Resistor Bridge). All the switching possibilities are changed through the BUS. Driving 75ohm load needs an external resistor. It is possible to have the same input connected to several outputs.

6. AUDIO AMPLIFIER STAGE WITH TDA8928

The TDA8928 is a switching power stage for a high efficiency class-D audio power amplifier system. With this power stage a compact 2 x 10 W self oscillating digital amplifier system can be built, operating with high efficiency and very low dissipation. No heatsink is required. The system operates over a wide supply voltage range from +-7.5 V up to +-30 V and consumes a very low quiescent current.

7. POWER SUPPLY (SMPS)

The DC voltages required at various parts of the chassis are provided by an SMPS transformer controlled by the IC MC44608, which is designed for driving, controlling and protecting switching transistor of SMPS. The transformer generates 145V for FBT input, +/-14V for audio amplifier, 5V and 3.3V stand by voltage and 8V, 12V and 5V supplies for other different parts of the chassis.

An optocoupler is used to control the regulation of line voltage and stand-by power consumption. There is a regulation circuit in secondary side. This circuit produces a control voltage according to the changes in 145V DC voltage, via an optocoupler (TCET1102G) to pin3 of the IC.

During the switch on period of the transistor, energy is stored in the transformer. During the switch off period energy is fed to the load via secondary winding. By varying switch-on time of the power transistor, it controls each portion of energy transferred to the second side such that the output voltage remains nearly independent of load variations.

8. MICROCONTROLLER

The microprocessor is embedded inside PW181 chip which also handles scaling, frame rate conversion and OSD generation. The on-chip 16-bit microprocessor is a Turbo x86-compatible processor core with on-chip peripherals (timers, interrupt controller, 2-wire serial master/slave interface, UART, I/O ports, and more). Special peripherals such as Infrared (IR) pulse decoders and a digital pulse width modulator (PWM) are also included. There are two independent 2-wire serial master/slave interface modules that can be multiplexed to control up to five 2-wire serial ports. The slave 2-wire interface is designed for HDCP use only (and requires the use of HDCP Image Processors). On-chip RAM of up to 64 Kbytes is available. A complete microprocessor system can be implemented simply by adding external ROM. The on-chip processor can be disabled to allow external processor control of all internal functions.

9. SERIAL ACCESS CMOS 4K x 8 (32K bit) EEPROM 24C32A

The Microchip Technology Inc. 24C32A is a 4K x 8 (32K bit) Serial Electrically Erasable PROM. It has been developed for advanced, low power applications such as personal communications or data acquisition. The 24C32A also has a page-write capability of up to 32 bytes of data. The 24C32A is capable of both random and sequential reads up to the 32K boundary. Functional address lines allow up to eight 24C32A devices on the same bus, for up to 256K bits address space. Advanced CMOS technology and broad voltage range make this device ideal for low-power/low-voltage, non-volatile code and data applications.

10. CLASS AB STEREO HEADPHONE DRIVER TDA1308

The TDA1308 is an integrated class AB stereo headphone driver contained in a DIP8 plastic package. The device is fabricated in a 1 mm CMOS process and has been primarily developed for portable digital audio applications.

11. SAW FILTERS

K9656M:

Standard:

- B/G
- D/K
- [
- L/L'

Features

- TV IF audio filter with two channels
- Channel 1 (L') with one pass band for sound carriers at 40.40 MHz (L') and 39.75 MHz (L'- NICAM)
- Channel 2 (B/G, D/K, L, I) with one pass band for sound carriers between 32.35 MHz and 33.40 MHz

Terminals

Tinned CuFe alloy

Pin configuration

- 1 Input
- 2 Switching input
- 3 Chip carrier ground
- 4 Output
- 5 Output

K3953M:

Standard:

- B/G
- D/K
- |
- L/L'

Features

TV IF video filter with Nyquist slopes at 33.90 MHz and 38.90 MHz Constant group delay Suitable for CENELEC EN 55020

Terminals

Tinned CuFe alloy

Pin configuration

- 1 Input
- 2 Input ground
- 3 Chip carrier ground
- 4 Output
- 5 Output

12.1. MC44608

12.1.1. Description

The MC44608 is a high performance voltage mode controller designed for off–line converters. This high voltage circuit that integrates the start–up current source and the oscillator capacitor, requires few external components while offering a high flexibility and reliability. The device also features a very high efficiency stand–by management consisting of an effective Pulsed Mode operation. This technique enables the reduction of the stand–by power consumption to approximately 1W while delivering 300mW in a 150W SMPS.

- Integrated Start-Up Current Source
- Fast Start-Up
- Lossless Off-Line Start-Up
- Direct Off-Line Operation

12.1.2. General Features

- Flexibility
- Duty Cycle Control
- Under voltage Lockout with Hysteresis
- On Chip Oscillator Switching Frequency 40, or 75kHz
- Secondary Control with Few External Components

Protections

- Maximum Duty Cycle Limitation
- Cycle by Cycle Current Limitation
- Demagnetization (Zero Current Detection) Protection
- "Over Vcc Protection" Against Open Loop
- Programmable Low Inertia Over Voltage Protection Against Open Loop
- Internal Thermal Protection

GreenLine[™] Controller

- Pulsed Mode Techniques for a Very High Efficiency Low Power Mode
- Lossless Startup
- Low dV/dT for Low EMI Radiations

12.1.3. Pin Connections

Pin	Name	Description
1	Demag	The Demag pin offers 3 different functions: Zero voltage crossing detection (50mV), 24mA current detection and 120mA current detection. The 24mA level is used to detect the secondary reconfiguration status and the 120mA level to detect an Over Voltage status called Quick OVP.
2	ISENSE	The Current Sense pin senses the voltage developed on the series resistor inserted in the source of the power MOSFET. When I sense reaches 1V, the Driver output (pin 5) is disabled. This is known as the Over Current Protection function. A 200mA current source is flowing out of the pin 3 during the start—up phase and during the switching phase in case of the Pulsed Mode of operation. A resistor can be inserted between the sense resistor and the pin 3; thus a programmable peak current detection can be performed during the SMPS stand—by mode.
3	Control Input	A feedback current from the secondary side of the SMPS via the opto–coupler is injected into this pin. A resistor can be connected between this pin and GND to allow the programming of the Burst duty cycle during the Stand–by mode.
4	Ground	This pin is the ground of the primary side of the SMPS.
5	Driver	The current and slew rate capability of this pin are suited to drive Power MOSFETs.
6	VCC	This pin is the positive supply of the IC. The driver output gets disabled when the voltage becomes higher than 15V and the operating range is between 6.6V and 13V. An intermediate voltage level of 10V creates a disabling condition called Latched Off phase.
7		This pin is to provide isolation between the Vi pin 8 and the VCC pin 6.
8	Vi	This pin can be directly connected to a 500V voltage source for start—up function of the IC. During the Start—up phase a 9 mA current source is internally delivered to the VCC pin 6 allowing a rapid charge of the VCC capacitor. As soon as the IC starts—up, this current source is disabled.

12.2. TCET1102G

12.2.1. Description

The TCET110/ TCET2100/ TCET4100 consists of a phototransistor optically coupled to a gallium arsenide infrared-emitting diode in a 4-lead up to 16-lead plastic dual inline package. The elements are mounted on one lead frame using a **coplanar technique**, providing a fixed distance between input and output for highest safety requirements.

12.2.2. Applications

Circuits for safe protective separation against electrical shock according to safety class II (reinforced isolation):

For appl. class I – IV at mains voltage ≤300 V For appl. class I – III at mains voltage ≤600 V

According to VDE 0884, table 2, suitable for: Switch-mode power supplies, line receiver, computer peripheral interface, microprocessor system interface.

12.2.3. 13.12.3.Features

VDE 0884 related features:

Rated impulse voltage (transient overvoltage) V IOTM = 8 kV peak Isolation test voltage (partial discharge test voltage) V pd = 1.6 kV Rated isolation voltage (RMS includes DC) V IOWM = 600 V RMS (848 V peak) Rated recurring peak voltage (repetitive) V IORM = 600 V RMS

General features:

CTR offered in 9 groups

Isolation materials according to UL94-VO

Pollution degree 2 (DIN/VDE 0110 / resp. IEC 664)

Climatic classification 55/100/21 (IEC 68 part 1)

Special construction: Therefore, extra low coupling capacity of typical 0.2pF, high Common Mode Rejection

Low temperature coefficient of CTR

G = Leadform 10.16 mm; provides creepage distance > 8 mm, for TCET2100/ TCET4100 optional; suffix letter 'G' is not marked on the optocoupler Coupling System U

12.3. TDA9886

12.3.1. General Description

The TDA9886 is an alignment-free single standard (without positive modulation) vision and sound IF signal PLL.

12.3.2. Features

- 5 V supply voltage
- Gain controlled wide-band Vision Intermediate Frequency (VIF) amplifier (AC-coupled)
- Multistandard true synchronous demodulation with active carrier regeneration (very linear demodulation, good intermodulation figures, reduced harmonics, excellent pulse response)
- Gated phase detector for L/L accent standard
- Fully integrated VIF Voltage Controlled Oscillator (VCO), alignment-free; frequencies switchable for all negative and positive modulated standards via I²C-bus
- Digital acquisition help, VIF frequencies of 33.4, 33.9, 38.0, 38.9, 45.75 and 58.75 MHz
- 4 MHz reference frequency input [signal from Phase-Locked Loop (PLL) tuning system] or operating as crystal oscillator
- VIF Automatic Gain Control (AGC) detector for gain control, operating as peak sync detector for negative modulated signals and as a peak white detector for positive modulated signals
- Precise fully digital Automatic Frequency Control (AFC) detector with 4-bit digital-to-analogue converter; AFC bits via I²C -bus readable

- TakeOver Point (TOP) adjustable via I2C-bus or alternatively with potentiometer
- Fully integrated sound carrier trap for 4.5, 5.5, 6.0 and 6.5 MHz, controlled by FM-PLL oscillator
- Sound IF (SIF) input for single reference Quasi Split Sound (QSS) mode (PLL controlled)
- SIF AGC for gain controlled SIF amplifier; single reference QSS mixer able to operate in high performance single reference QSS mode and in intercarrier mode, switchable via I²C-bus
- AM demodulator without extra reference circuit
- Alignment-free selective FM-PLL demodulator with high linearity and low noise
- I2C-bus control for all functions
- I2C-bus transceiver with pin programmable Module Address (MAD).

12.3.3. Pinning

SYMBOL	PIN	DESCRIPTION
VIF1	1	VIF differential input 1
VIF2	2	VIF differential input 2
OP1	3	output 1 (open-collector)
FMPLL	4	FM-PLL for loop filter
DEEM	5	de-emphasis output for capacitor
AFD	6	AF decoupling input for capacitor
DGND	7	digital ground
AUD	8	audio output
TOP	9	tuner AGC TakeOver Point (TOP)
SDA	10	I ² C-bus data input/output
SCL	11	I ² C-bus clock input
SIOMA	12	sound intercarrier output and MAD select
n.c.	13	not connected
TAGC	14	tuner AGC output
REF	15	4 MHz crystal or reference input
VAGC	16	VIF-AGC for capacitor; note 1
CVBS	17	video output
AGND	18	analog ground
VPLL	19	VIF-PLL for loop filter
V _P	20	supply voltage (+5 V)
AFC	21	AFC output
OP2	22	output 2 (open-collector)
SIF1	23	SIF differential input 1
SIF2	24	SIF differential input 2

12.4. TEA6415C

12.4.1. General Description

The main function of the IC is to switch 8 video input sources on 6 outputs. Each output can be switched on only one of each input. On each input an alignment of the lowest level of the signal is made (bottom of synch. top for CVBS or black level for RGB signals). Each nominal gain between any input and output is 6.5dB. For D2MAC or Chroma signal the alignment is switched off by forcing, with an external resistor bridge, 5 Vpc on the input. Each input can be used as a normal input or as a MAC or Chroma input (with external resistor bridge). All the switching possibilities are changed through the BUS. Driving 75Ω load needs an external transistor. It is possible to have the same input connected to several outputs. The starting configuration upon power on (power supply: 0 to 10V) is undetermined. In this case, 6 words of 16 bits are necessary to determine one configuration. In other case, 1 word of 16 bits is necessary to determine one configuration.

12.4.2. Features

- · 20MHz Bandwidth
- Cascadable with another TEA6415C (Internal address can be changed by pin 7 voltage)
- 8 Inputs (CVBS, RGB, MAC, CHROMA,...)
- 6 Outputs

- Possibility of MAC or chroma signal for each input by switching-off the clamp with an external resistor bridge
- · Bus controlled
- 6.5dB gain between any input and output
- 55dB crosstalk at 5mHz
- Fully ESD protected

12.5. SAA3010T

12.5.1. Description

The SAA3010 is intended as a general purpose (RC-5) infrared remote control system for use where a low voltage supply and a large debounce time are expected. The device can generate 2048 different commands and utilizes a keyboard with a single pole switch for each key. The commands are arranged so that 32 systems can be addressed, each system containing 64 different commands. The circuit response to legal (one key pressed at a time) and illegal (more than one key pressed at a time) keyboard operation is specified in the section "Keyboard operation".

12.5.2. Features

Low voltage requirement Biphase transmission technique Single pin oscillator Test mode facility

12.5.3. Pinning

Pin	Mnemonic	Function			
1	X7 (IPU)	sense input from key matrix			
2	SSM (I)	sense mode selection input			
3	Z0-Z3 (IPU)	sense inputs from key matrix			
7	MDATA (OP3)	generated output data modulated with 1/12 the oscillator frequency at a 25% duty factor			
8	DATA (OP3)	generated output information			
9-13	DR7-DR3 (ODN)	Scan drivers			
14	VSS	Ground (0V)			
15-17	DR-2-DR0 (ODN)	Scan drivers			
18	OSC (I)	Oscillator input			
19	TP2 (I)	test point 2			

20	TP1 (I)	Test point 1
21-27	X0-X6 (IPU)	Sense inputs from key matrix
28	VDD(I)	Voltage supply

Note:

(I): Input,

(IPU): input with p-channel pull-up transistor, (ODN): output with open drain n-channel transistor

(OD3): output 3-state

12.6. 24C32A

12.6.1. **Features**

- Voltage operating range: 4.5V to 5.5V
- Maximum write current 3 mA at 5.5V
- Standby current 1 mA typical at 5.0V
- 2-wire serial interface bus, I²CTM compatible
- 100 kHz and 400 kHz compatibility
- Self-timed ERASE and WRITE cycles
- Power on/off data protection circuitry
- Hardware write protect
- 1,000,000 Erase/Write cycles guaranteed
- 32-byte page or byte write modes available
- Schmitt trigger filtered inputs for noise suppression
- Output slope control to eliminate ground bounce
- 2 ms typical write cycle time, byte or page
- Up to eight devices may be connected to the same bus for up to 256K bits total memory
- Electrostatic discharge protection > 4000V
- Data retention > 200 years
- 8-pin PDIP and SOIC packages
- Temperature ranges
- Commercial (C): 0°C to 70°C
- Industrial (I): -40°C to +85°C
- Automotive (E): -40°C to +125°C

12.6.2. Description

The Microchip Technology Inc. 24C32A is a 4K x 8 (32K bit) Serial Electrically Erasable PROM. It has been developed for advanced, low power applications such as personal communications or data acquisition. The 24C32A also has a page-write capability of up to 32 bytes of data. The 24C32A is capable of both random and sequential reads up to the 32K boundary. Functional address lines allow up to eight 24C32A devices on the same bus, for up to 256K bits address space. Advanced CMOS technology and broad voltage range make this device ideal for low-power/low-voltage, non-volatile code and data applications. The 24C32A is available in the standard 8-pin plastic DIP and both 150 mil and 200 mil SOIC packaging.

12.6.3. Pin Function table

Name	Function
A0, A1, A2	User Configurable Chip Selects
V _{ss}	Ground
SDA	Serial Address/Data I/O
SCL	Serial Clock
WP	Write Protect Input
V _{cc}	+4.5V to 5.5V Power Supply

12.6.4. Functional Descriptions

The 24C32A supports a Bi-directional 2-wire bus and data transmission protocol. A device that sends data onto the bus is defined as transmitter, and a device receiving data as receiver. The bus must be controlled by a master device which generates the Serial Clock (SCL), controls the bus access, and generates the START and STOP conditions, while the 24C32A works as slave. Both master and slave can operate as transmitter or receiver but the master device determines which mode is activated.

12.7. SAA5264

12.7.1. Features

The following features apply to both SAA5264 and SAA5265:

- Complete 625 line teletext decoder in one chip reduces printed circuit board area and cost
- Automatic detection of transmitted fastext links or service information (packet 8/30)
- On-Screen Display (OSD) for user interface menus using teletext and dedicated menu icons
- Video Programming System (VPS) decoding
- Wide Screen Signalling (WSS) decoding
- Pan-European, Cyrillic, Greek/Turkish and French/Arabic character sets in each chip
- High-level command interface via l²C-bus gives easy control with a low software overhead
- High-level command interface is backward compatible to Stand-Alone Fastext And Remote Interface (SAFARI)
- 625 and 525 line display
- RGB interface to standard colour decoder ICs, current source
- Versatile 8-bit open-drain Input/Output (I/O) expander, 5 V tolerant
- Single 12 MHz crystal oscillator
- 3.3 V supply voltage.

SAA5264 features

- Automatic detection of transmitted pages to be selected by page up and page down
- 8 Page fastext decoder
- Table Of Pages (TOP) decoder with Basic Top Table (BTT) and Additional Information Tables (AITs)
- 4 Page user-defined list mode.

12.7.2. General Description

The SAA5264 is a single-chip ten page 625-line World System Teletext decoder with a high-level command interface, and is SAFARI compatible.

The device is designed to minimize the overall system cost, due to the high-level command interface offering the benefit of a low software overhead in the TV microcontroller.

The SAA5264 has the following functionality:

- 10 page teletext decoder with OSD, Fastext, TOP, default and list acquisition modes
- Automatic channel installation support
- Closed caption acquisition and display
- Violence Chip (VChip) support.

12.8. LM317

12.8.1. General Description

The LM117/LM217/LM317 are monolithic integrated circuit in TO-220, ISOWATT220, TO-3 and D ² PAK packages intended for use as positive adjustable voltage regulators.

They are designed to supply more than 1.5A of load current with an output voltage adjustable over a 1.2 to 37V range.

The nominal output voltage is selected by means of only a resistive divider, making the device exceptionally easy to use and eliminating the stocking of many fixed regulators.

12.8.2. Features

- Output voltage range: 1.2 To 37V
- Output current In excess of 1.5A
- 0.1% Line and Load Regulation
- Floating Operation for High Voltages
- Complete Series of Protections: Current Limiting, Thermal Shutdown And Soa Control

12.9. LM393

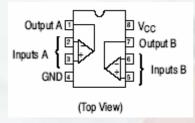

12.9.1. Description

The LM393 series are dual independent precision voltage comparators capable of single or split supply operation. These devices are designed to permit a common mode range-to-ground level with single supply operation. Input offset voltage specifications as low as 2.0 mV make this device an excellent selection for many applications in consumer, automotive, and industrial electronics.

12.9.2. Features

- Wide Single-Supply Range: 2.0 Vdc to 36 Vdc
- Split-Supply Range: ±1.0 Vdc to ±18 Vdc
- Very Low Current Drain Independent of Supply Voltage: 0.4 mA
- Low Input Bias Current: 25 nA
- Low Input Offset Current: 5.0 nA
- Low Input Offset Voltage: 5.0 mV (max) LM293/393
- Input Common Mode Range to Ground Level
- Differential Input Voltage Range Equal to Power Supply Voltage
- Output Voltage Compatible with DTL, ECL, TTL, MOS, and CMOS Logic Levels
- ESD Clamps on the Inputs Increase the Ruggedness of the Device without Affecting Performance
- NCV Prefix for Automotive and Other Applications Requiring Site and Control Changes
- Pb-Free Packages are Available

12.9.3. Pin Connections

12.10. ST24LC21

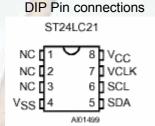

12.10.1. Description

The ST24LC21 is a 1K bit electrically erasable programmable memory (EEPROM), organized by 8 bits. This device can operate in two modes: Transmit Only mode and I²C bidirectional mode. When powered, the device is in Transmit Only mode with EEPROM data clocked out from the rising edge of the signal applied on VCLK. The device will switch to the I²C bidirectional mode upon the falling edge of the signal applied on SCL pin. The ST24LC21 can not switch from the I²C bidirectional mode to the Transmit Only mode (except when the power supply is removed). The device operates with a power supply value as low as 2.5V. Both Plastic Dual-in-Line and Plastic Small Outline packages are available.

12.10.2. Features

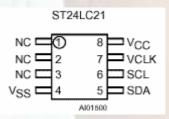

- 1 million Erase/Write cycles
- · 40 years data retention
- 2.5V To 5.5V single supply voltage
- 400k Hz compatibility over the full range of supply voltage
- Two wire serial interface I²C bus compatible
- Page Write (Up To 8 Bytes)
- Byte, random and sequential read modes
- Self timed programming cycle
- Automatic address incrementing
- Enhanced ESD/Latch up
- Performances

V _{ss}	Ground		
VCLK	Clock transmit only mode		

12.11. TLC7733

12.11.1. Description

The TLC77xx family of micropower supply voltage supervisors are designed for reset control, primarily in microcomputer and microprocessor systems.

During power-on, RESET is asserted when V_{DD} reaches 1 V. After minimum V_{DD} (.2 V) is established, the circuit monitors SENSE voltage and keeps the reset outputs active as long as SENSE voltage (V_{USENSE})

remains below the threshold voltage. An internal timer delays return of the output to the inactive state to ensure proper system reset. The delay time, t_d, is determined by an external capacitor:

 $t_d = 2.1 \times 10.4 \times C_T$

where

C_T is in farads

t_d is in seconds

The TLC77xx has a fixed SENSE threshold voltage set by an internal voltage divider. When SENSE voltage drops below the threshold voltage, the outputs become active and stay in that state until SENSE voltage returns above threshold voltage and the delay time, t_d, has expired.

In addition to the power-on-reset and undervoltage-supervisor function, the TLC77xx adds power-down control support for static RAM. When CONTROL is tied to GND, RESET will act as active high. The voltage monitor contains additional logic intended for control of static memories with battery backup during power failure. By driving the chip select (CS) of the memory circuit with the RESET output of the TLC77xx and with the CONTROL driven by the memory bank select signal (CSH1) of the microprocessor (see Figure 10), the memory circuit is automatically disabled during a power loss. (In this application the TLC77xx power has to be supplied by the battery.)

The TLC77xxQ is characterized for operation over a temperature range of –40°C to 125°C, and the TLC77xxI is characterized for operation over a temperature range of –40°C to 85°C.

12.11.2. 74LVC257A

12.11.3. Features

Wide supply voltage range of 1.2 to 3.6 V
In accordance with JEDEC standard no. 8-1A
CMOS lower power consumption
Direct interface with TTL levels
Output drive capability 50 _ transmission lines at 85°C
5 Volt tolerant inputs/outputs, for interfacing with 5 Volt logic

12.11.4. Description

The 74LVC257A is a high-performance, low-power, low-voltage, Si-gate CMOS device and superior to most advanced CMOS compatible TTL families.

Inputs can be driven from either 3.3V or 5.0V devices. In 3-State operation, outputs can handle 5V. This feature allows the use of these devices as translators in a mixed 3.3V/5V environment.

The 74LVC257A is a quad 2-input multiplexer with 3-state outputs, which select 4 bits of data from two sources and are controlled by a common data select input (S). The data inputs from source 0 (1I 0 to 4I 0) are selected when input S is LOW and the data inputs from source 1 (1I 1 to 4I 1) are selected when S in HIGH. Data appears at the outputs (1Y to 4Y) in true (non-inverting) form from the selected inputs. The 74LVC257A is the logic implementation of a 4-pole, 2-position switch, where the position of the switch is determined by the logic levels applied to S. The outputs are forced to a high impedance OFF-state when OE is HIGH.

12.11.5. Pin Description

PIN NUMBER	SYMBOL	DESCRIPTION
1	S	Common data select input
2, 5, 11, 14	$1 _{0}$ to $4 _{0}$	Data inputs from source 0
3, 6, 10, 13	1 ₁ to 4 ₁	Data outputs from source 1
4,7,9,12	1Y to 4Y	3-State multiplexer outputs
8	GND	Ground (0V)
15	OE	3-State output enable input (active LOW)
16	V _{cc}	Positive supply voltage

12.12. 74LVC14A

12.12.1. Features

- Wide supply voltage range of 1.2 to 3.6 V
- In accordance with JEDEC standard no. 8-1A
- Inputs accept voltages up to 5.5 V
- CMOS low power consumption
- Direct interface with TTL levels

12.12.2. Applications

- Wave and pulse shapers for highly noisy environments
- Astable multivibrators
- Monostable multivibrators

12.12.3. Description

The 74LVC14A is a high-performance, low power, low-voltage Si-gate CMOS device and superior to most advanced CMOS compatible TTL families.

Inputs can be driven from either 3.3 V or 5 V devices. This feature allows the use of these devices as translators in a mixed 3.3 V/5 V environment.

The 74LVC14A provides six inverting buffers with Schmitt-trigger action. It is capable of transforming slowly changing input signals into sharply defined, jitter-free output signals.

12.12.4. Pin Description

PIN NUMBER	SYMBOL	DESCRIPTION
1, 3, 5, 9, 11, 13	1A – 6A	Data inputs
2, 4, 6, 8, 10, 12	1Y – 6Y	Data outputs
7	GND	Ground (0V)
14	V _{cc}	Positive supply voltage

12.13. LM1086

12.13.1. Description

The LM1086 is a series of low dropout positive voltage regulators with a maximum dropout of 1.5V at 1.5A of load current. It has the same pin-out as National Semiconductor's industry standard LM317. The LM1086 is available in an adjustable version, which can set the output voltage with only two external resistors. It is also available in five fixed voltages: 2.5V, 2.85V, 3.3V, 3.45V and 5.0V. The fixed versions integrate the adjust resistors. The LM1086 circuit includes a zener trimmed band-gap reference, current limiting and thermal shutdown.

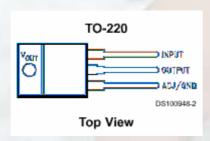

12.13.2. Features

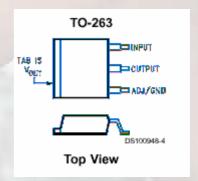

- Available in 2.5V, 2.85V, 3.3V, 3.45V, 5V and Adjustable Versions
- Current Limiting and Thermal Protection
- Output Current 1.5A
- Line Regulation 0.015% (typical)
- Load Regulation 0.1% (typical)

12.13.3. Applications

- SCSI-2 Active Terminator
- High Efficiency Linear Regulators
- Battery Charger
- Post Regulation for Switching Supplies
- Constant Current Regulator
- Microprocessor Supply

12.13.4. Connection Diagrams

12.14. LM1117

12.14.1. General Description

The LM1117 is a series of low dropout voltage regulators with a dropout of 1.2V at 800mA of load current. It has the same pin-out as National Semiconductor's industry standard LM317. The LM1117 is available in an adjustable version, which can set the output voltage from 1.25V to 13.8V with only two external resistors. In addition, it is also available in five fixed voltages, 1.8V, 2.5V, 2.85V, 3.3V, and 5V. The LM1117 offers current limiting and thermal shutdown. Its circuit includes a zener trimmed bandgap reference to as-sure output voltage accuracy to within $\pm 1\%$. The LM1117 series is available in SOT-223, TO-220, and TO-252 D-PAK packages. A minimum of 10μ F tantalum capacitor is required at the output to improve the transient response and stability.

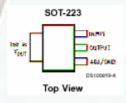

12.14.2. Features

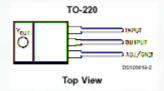

- Available in 1.8V, 2.5V, 2.85V, 3.3V, 5V, and Adjustable Versions
- Space Saving SOT-223 Package
- Current Limiting and Thermal Protection
- Output Current 800mA
- Line Regulation 0.2% (Max)
- Load Regulation 0.4% (Max)
- Temperature Range
- LM1117 0°C to 125°C
- LM1117I -40°C to 125°C

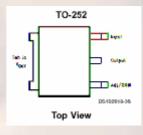

12.14.3. Applications

- 2.85V Model for SCSI-2 Active Termination
- Post Regulator for Switching DC/DC Converter
- High Efficiency Linear Regulators
- Battery Charger
- Battery Powered Instrumentation

12.14.4. Connection Diagrams

12.15. DS90C385

12.15.1. General Description

The DS90C385 transmitter converts 28 bits of LVCMOS/LVTTL data into four LVDS (Low Voltage Differential Signaling) data streams. A phase-locked transmit clock is transmitted in parallel with the data streams over a fifth LVDS link.

Every cycle of the transmit clock 28 bits of input data are sampled and transmitted. At a transmit clock frequency of 85 MHz, 24 bits of RGB data and 3 bits of LCD timing and control data (FPLINE, FPFRAME, DRDY) are transmitted at a rate of 595 Mbps per LVDS data channel. Using an 85 MHz clock, the data throughput is 297.5 Mbytes/sec. Also available is the DS90C365 that converts 21 bits of LVCMOS/LVTTL data into three LVDS (Low Voltage Differential Signaling) data streams. Both transmitters can be programmed for Rising edge strobe or falling edge strobe through a dedicated pin. A Rising edge or Falling edge strobe transmitter will interoperate with a Falling edge strobe Receiver (DS90CF386/DS90CF366) without any translation logic.

The DS90C385 is also offered in a 64 ball, 0.8mm fine pitch ball grid array (FBGA) package which provides a 44 % reduction in PCB footprint compared to the TSSOP package. This chipset is an ideal means to solve EMI and cable size problems associated with wide, high-speed TTL interfaces.

12.15.2. Features

- 20 to 85 MHz shift clock support
- Best-in-Class Set & Hold Times on TxINPUTs
- Tx power consumption <130 mW (typ) @85MHz Grayscale
- Tx Power-down mode <200µW (max)
- Supports VGA, SVGA, XGA and Dual Pixel SXGA.
- Narrow bus reduces cable size and cost
- Up to 2.38 Gbps throughput
- Up to 297.5 Megabytes/sec bandwidth
- 345 mV (typ) swing LVDS devices for low EMI
- PLL requires no external components
- Compatible with TIA/EIA-644 LVDS standard
- Low profile 56-lead or 48-lead TSSOP package
- DS90C385 also available in a 64 ball, 0.8mm fine pitch ball grid array (FBGA) package

12.15.3. Pin Description

12.16. TL431

12.16.1. Description

The TL431 is a 3-terminal adjustable shunt voltage regulator providing a highly accurate 1 % band gap reference. TL431 acts as an open-loop error amplifier with a 2.5V temperature compensation reference. The TL431 thermal stability, wide operating current (150mA) and temperature range (0.to 105.makes it suitable for all variety of application that are looking for a low cost solution with high performance. The output voltage may be adjusted to any value between VREF and 36 volts with two external resistors. The TL431 is operating in full industrial temperature range of 0°C to 105°C. The TL431 is available in TO-92, SO-8, SOT-89 and SOT23-5 packages.

1mA to 150mA

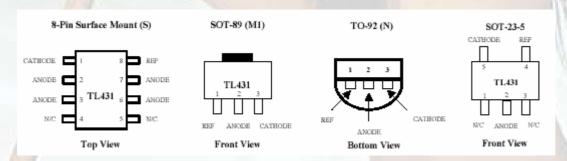

0. °C to 105.°C

30 ppm /°C

12.16.2. Features

- Trimmed Band gap to 1%
- Wide Operating Current
- Extended Temperature Range
- Low Temperature Coefficient
- Offered in TO-92, SOIC, SOT-89, SOT-23-5
- Improved Replacement in Performance for TL431
- Low Cost Solution

12.16.3. Pin Configurations

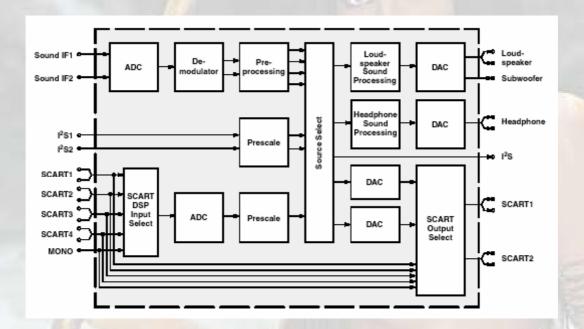

12.17. MSP34X0G (MSP3410G) Multistandard Sound Processor Family

12.17.1. Introduction

The MSP 34x0G family of single-chip Multistandard Sound Processors covers the sound processing of all analog TV-Standards worldwide, as well as the NICAM digital sound standards. The full TV sound processing, starting with analog sound IF signal-in, down to processed analog AF-out, is performed on a single chip. Figure shows a simplified functional block diagram of the MSP 34x0G.

This new generation of TV sound processing ICs now includes versions for processing the multichannel television sound (MTS) signal conforming to the standard recommended by the Broadcast Television Systems Committee (BTSC). The DBX noise reduction, or alternatively, MICRONAS Noise Reduction (MNR) is performed alignment free. Other processed standards are the Japanese FM-FM multiplex standard (EIA-J) and the FM Stereo Radio standard. Current ICs have to perform adjustment procedures in order to achieve good stereo separation for BTSC and EIA-J. The MSP 34x0G has optimum stereo performance without any adjustments.

All MSP 34x0G versions are pin and software downward compatible to the MSP 34x0D. The MSP 34x0G further simplifies controlling software. Standard selection requires a single I²C transmission only. The MSP 34x0G has built-in automatic functions: The IC is able to detect the actual sound standard automatically (Automatic Standard Detection). Furthermore, pilot levels and identification signals can be evaluated internally with subsequent switching between mono/stereo/bilingual; no I²C interaction is necessary (Automatic Sound Selection).

Source Select

I²S bus interface consists of five pins:

- 1. I2S_DA_IN1, I2S_DA_IN2: For input, four channels (two channels per line, 2*16 bits) per sampling cycle (32 kHz) are transmitted.
- 2. I2S DA OUT: For output, two channels (2*16 bits) per sampling cycle (32 kHz) are transmitted.
- 3. I2S_CL: Gives the timing for the transmission of I²S serial data (1.024 MHz).
- 4. I2S_WS: The I2S_WS word strobe line defines the left and right sample.

12.17.2. Features

- Standard Selection with single I²C transmission
- Automatic Standard Detection of terrestrial TV standards
- Automatic Sound Selection (mono/stereo/bilingual), new registers MODUS, STATUS
- Two selectable sound IF (SIF) inputs
- Automatic Carrier Mute function
- Interrupt output programmable (indicating status change)
- Loudspeaker / Headphone channel with volume, balance, bass, treble, loudness
- AVC: Automatic Volume Correction
- Subwoofer output with programmable low-pass and complementary high-pass filter
- 5-band graphic equalizer for loudspeaker channel
- Spatial effect for loudspeaker channel
- Four Stereo SCART (line) inputs, one Mono input; two Stereo SCART outputs
- Complete SCART in/out switching matrix
- Two I²S inputs; one I²S output
- Dolby Pro Logic with DPL 351xA coprocessor
- All analog FM-Stereo A2 and satellite standards; AM-SECAM L standard
- Simultaneous demodulation of (very) high-deviation FM-Mono and NICAM
- Adaptive deemphasis for satellite (Wegener-Panda, acc. to ASTRA specification)
- ASTRA Digital Radio (ADR) together with DRP 3510A
- All NICAM standards
- · Korean FM-Stereo A2 standard

12.17.3. Pin connections

NC = not connected; leave vacant LV = if not used, leave vacant

OBL = obligatory; connect as described in circuit diagram

DVSS: if not used, connect to DVSS

AHVSS: connect to AHVSS

12.18. TDA8928

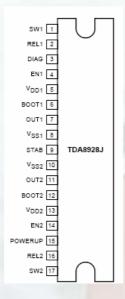

12.18.1. Description

The TDA8928J is a switching power stage for a high efficiency class-D audio power amplifier system. With this power stage a compact 2 x 10 W self oscillating digital amplifier system can be built, operating with high efficiency and very low dissipation. No heatsink is required. The system operates over a wide supply voltage range from +-7.5 V up to +-30 V and consumes a very low quiescent current.

12.18.2. Features

- Wide Supply Voltage Range (Up to±25V ABS Max.)
- Split Supply
- High Output Power
- 25 + 25W @THD =10%, RL =8W, VS= +20V
- No Popat Turn-On/Off
- Mute (Pop Free)
- Stand-By Feature (Low ig)
- Short Circuit Protection
- Thermal Overload Protection

12.18.3. Pin Connection

12.19. TDA1308

12.19.1. General Description

The TDA1308 is an integrated class AB stereo headphone driver contained in an SO8 or a DIP8 plastic package. The device is fabricated in a 1 mm CMOS process and has been primarily developed for portable digital audio applications. It gets its input from two analogue audio outputs (DACA_L and DACA_R) of MSP 34x0G. The gain of the output is adjustable by the feedback resistor between the inputs and outputs.

12.19.2. Features

- · Wide temperature range
- No switch ON/OFF clicks
- Excellent power supply ripple rejection
- Low power consumption
- Short-circuit resistant
- High performance
- High signal-to-noise ratio
- High slew rate
- Low distortion
- Large output voltage swing.

12.19.3. Pinning

SYMBOL	PIN	DESCRIPTION
OUTA	1	Output A
INA(neg)	2	Inverting input A
INA(pos)	3	Non-inverting input A
V _{SS}	4	Negative supply
INB(pos)	5	Non-inverting input B
INB(neg)	6	Inverting input B
OUTB	7	Output B
V_{DD}	8	Positive supply

12.20. PI5V330

12.20.1. General Description

The PI5V330 is well suited for video applications when switching composite or RGB analogue. A picture-in-picture application will be described in this brief. The pixel-rate creates video overlays so two or more pictures can be viewed at the same time. An inexpensive NTSC titler can be implemented by superimposing the output of a character generator on a standard composite video background.

12.21. AD9883A

12.21.1. General Description

The AD9883A is a complete 8-bit, 140 MSPS, monolithic analog interface optimized for capturing RGB graphics signals from personal computers and workstations. Its 140 MSPS encode rate capability and full power analog bandwidth of 300 MHz supports resolutions up to SXGA (1280 × 1024 at 75 Hz).

The AD9883A includes a 140 MHz triple ADC with internal 1.25 V reference, a PLL, and programmable gain, offset, and clamp control. The user provides only a 3.3 V power supply, analog input, and Hsync and COAST signals. Three-state CMOS outputs may be powered from 2.5 V to 3.3 V.

The AD9883A's on-chip PLL generates a pixel clock from the Hsync input. Pixel clock output frequencies range from 12 MHz to140 MHz. PLL clock jitter is 500 ps p-p typical at 140 MSPS. When the COAST signal is presented, the PLL maintains its output frequency in the absence of Hsync. A sampling phase adjustment is provided. Data, Hsync, and clock output phase relationships are maintained. The AD9883A also offers full sync processing for composite sync and sync-on-green applications. A clamp signal is generated internally or may be provided by the user through the CLAMP input pin. This interface is fully programmable via a 2-wire serial interface.

Fabricated in an advanced CMOS process, the AD9883A is provided in a space-saving 80-lead LQFP surface-mount plastic package and is specified over the –40.°C to +85.°C temperature range.

12.21.2. Features

- Industrial Temperature Range Operation
- 140 MSPS Maximum Conversion Rate
- 300 MHz Analog Bandwidth
- 0.5 V to 1.0 V Analog Input Range500 ps p-p PLL Clock Jitter at 110 MSPS
- 3.3 V Power Supply
- Full Sync Processing
- Sync Detect for Hot Plugging
- Midscale Clamping
- Power-Down Mode
- Low Power: 500 mW Typical
- 4:2:2 Output Format Mode
- APPLICATIONS
- RGB Graphics Processing
- LCD Monitors and Projectors
- Plasma Display Panels
- Scan Converters
- Microdisplays
- Digital TV

12.21.3. Pin Descriptions

Pin Function Descriptions Pin Name	Function				
OUTPUTS					
HSOUT	Horizontal Sync Output A reconstructed and phase-aligned version of the Hsync input. Both the polari and duration of this output can be programmed via serial bus registers. E maintaining alignment with DATACK and Data, data timing with respect horizontal sync can always be determined.				
VSOUT	Vertical Sync Output A reconstructed and phase-aligned version of the video Vsync. The polarity of this output can be controlled via a serial bus bit. The placement and duration in all modes is set by the graphics transmitter.				
SOGOUT	Sync-On-Green Slicer Output This pin outputs either the signal from the Sync-on-Green slicer comparator or an unprocessed but delayed version of the Hsync input. See the Sync Processing Block Diagram (Figure 12) to view how this pin is connected. (Note: Besides slicing off SOG, the output from this pin gets no other additional processing on the AD9883A. Vsync separation is performed via the sync separator.)				
SERIAL PORT (2-WIRE)					
SDA	Serial Port Data I/O				
SCL A0	Serial Port Data Clock Serial Port Address Input 1 For a full description of the 2-wire serial register and how it works, refer to the 2-Wire Serial Control Port section.				
DATA OUTPUTS	Wife Selial Control Fort Section.				
RED	Data Output, Red Channel				
GREEN	Data Output, Red Grannel Data Output, Green Channel				
BLUE					
BLUE	Data Output, Blue Channel The main data outputs. Bit 7 is the MSB. The delay from pixel sampling time to output is fixed. When the sampling time is changed by adjusting the PHASE register, the output timing is shifted as well. The DATACK and HSOUT outputs are also moved, so the timing relationship among the signals is maintained. For exact timing information, refer to Figures 7, 8, and 9.				
DATA CLOCK OUTPUT DATACK	Data Output Clock				
	This is the main clock output signal used to strobe the output data and HSOUT into external logic. It is produced by the internal clock generator and is synchronous with the internal pixel sampling clock. When the sampling time is changed by adjusting the PHASE register, the output timing is shifted as well. The Data, DATACK, and HSOUT outputs are all moved, so the timing relationship among the signals is maintained.				
INPUTS					
RAIN	Analog Input for Red Channel				
GAIN	Analog Input for Green Channel				
BAIN	Analog Input for Blue Channel High impedance inputs that accept the Red, Green, and Blue channel graphics				
	signals, respectively. (The three channels are identical, and can be used for any				
	colors, but colors are assigned for convenient reference.) They accommodate input signals ranging from 0.5 V to 1.0 V full scale. Signals should be ac-coupled to these pins to support clamp operation.				
HSYNC	Horizontal Sync Input				
	This input receives a logic signal that establishes the horizontal timing reference and provides the frequency reference for pixel clock generation. The logic sense of this pin is controlled by serial register 0EH Bit 6 (Hsync Polarity). Only the leading edge of Hsync is active; the trailing edge is ignored. When Hsync Polarity = 0, the falling edge of Hsync is used. When Hsync Polarity = 1, the rising edge is active.				
	The input includes a Schmitt trigger for noise immunity, with a nominal input threshold of 1.5 V.				

	This is the input for vertical sync.
SOGIN	Sync-on-Green Input This input is provided to assist with processing signals with embedded sync, typically on the Green channel. The pin is connected to a high speed comparator with an internally generated threshold. The threshold level can be programmed in 10 mV steps to any voltage between 10 mV and 330 mV above the negative peak of the input signal. The default voltage threshold is 150 mV. When connected to an ac-coupled graphics signal with embedded sync, it will produce a noninverting digital output on SOGOUT. (This is usually a composite sync signal, containing both vertical and horizontal sync information that must be separated before passing the horizontal sync signal to Hsync.) When not used, this input should be left unconnected. For more details on this function and how it should be configured, refer to the Sync-on-Green section.
CLAMP	External Clamp Input This logic input may be used to define the time during which the input signal is clamped to ground. It should be exercised when the reference dc level is known to be present on the analog input channels, typically during the back porch of the graphics signal. The CLAMP pin is enabled by setting control bit Clamp Function to 1, (register 0FH, Bit 7, default is 0). When disabled, this pin is ignored and the clamp timing is determined internally by counting a delay and duration from the trailing edge of the Hsync input. The logic sense of this pin is controlled by Clamp Polarity register 0FH, Bit 6. When not used, this pin must be grounded and Clamp Function programmed to 0.
COAST	Clock Generator Coast Input (Optional) This input may be used to cause the pixel clock generator to stop synchronizing with Hsync and continue producing a clock at its current frequency and phase. This is useful when processing signals from sources that fail to produce horizontal sync pulses during the vertical interval. The COAST signal is generally not required for PC-generated signals. The logic sense of this pin is controlled by Coast Polarity (register 0FH, Bit 3). When not used, this pin may be grounded and Coast Polarity programmed to 1, or tied HIGH (to VD through a 10 k resistor) and Coast Polarity programmed to 0. Coast Polarity defaults to 1 at power-up.
REF BYPASS	Internal Reference BYPASS Bypass for the internal 1.25 V band gap reference. It should be connected to ground through a 0.1 μ F capacitor. The absolute accuracy of this reference is $\pm 4\%$, and the temperature coefficient is ± 50 ppm, which is adequate for most AD9883A applications. If higher accuracy is required, an external reference may be employed instead.
MIDSCV	Midscale Voltage Reference BYPASS Bypass for the internal midscale voltage reference. It should be connected to ground through a 0.1 µF capacitor. The exact voltage varies with the gain setting of the Blue channel.
FILT	External Filter Connection For proper operation, the pixel clock generator PLL requires an external filter. Connect the filter shown in Figure 6 to this pin. For optimal performance, minimize noise and parasitics on this node.
POWER SUPPLY VD	Main Power Supply These pins supply power to the main elements of the circuit. They should be filtered and as quiet as possible.
VDD	Digital Output Power Supply A large number of output pins (up to 25) switching at high speed (up to 110 MHz) generates a lot of power supply transients (noise). These supply pins are identified separately from the VD pins so special care can be taken to minimize output noise transferred into the sensitive analog circuitry. If the AD9883A is interfacing with lower voltage logic, V DD may be connected to a lower supply voltage (as low as 2.5 V) for compatibility.
PVD	Clock Generator Power Supply The most sensitive portion of the AD9883A is the clock generation circuitry. These

	pins provide power to the clock PLL and help the user design for optimal performance. The designer should provide quiet, noise-free power to these pins.
GND	Ground
	The ground return for all circuitry on-chip. It is recommended that the AD9883A be
	assembled on a single solid ground plane, with careful attention given to ground
	current paths.

12.22. SAA7118E

12.22.1. General Description

The SAA7118E is a video capture device for applications at the image port of VGA controllers. Philips X-VIP is a new multistandard comb filter video decoder chip with additional component processing, providing high quality, optionally scaled, video.

The SAA7118E is a combination of a four-channel analog preprocessing circuit including source selection, anti-aliasing filter and ADC, an automatic clamp and gain control, a Clock Generation Circuit (CGC), a digital multistandard decoder containing two-dimensional chrominance/luminance separation by an adaptive comb filter and a high performance scaler, including variable horizontal and vertical up and downscaling and a brightness, contrast and saturation control circuit.

It is a highly integrated circuit for desktop video and similar applications. The decoder is based on the principle of line-locked clock decoding and is able to decode the colour of PAL, SECAM and NTSC signals into ITU 601 compatible colour component values. The SAA7118E accepts CVBS or S-video (Y/C) as analog inputs from TV or VCR sources, including weak and distorted signals as well as baseband component signals Y-P_B -P_R or RGB. An expansion port (X-port) for digital video (bidirectional half duplex, D1 compatible) is also supported to connect to MPEG or video phone codec. At the so called image port (I-port) the SAA7118E supports 8 or 16-bit wide output data with auxiliary reference data for interfacing to VGA controllers.

The target application for the SAA7118E is to capture and scale video images, to be provided as digital video stream through the image port of a VGA controller, for capture to system memory, or just to provide digital baseband video to any picture improvement processing.

12.22.2. Features

Video acquisition/clock

- Up to sixteen analog CVBS, split as desired (all of the CVBS inputs optionally can be used to convert e.g. Vestigial Side Band (VSB) signals)
- Up to eight analog Y + C inputs, split as desired
- Up to four analog component inputs, with embedded or separate sync, split as desired
- Four on-chip anti-aliasing filters in front of the Analog-to-Digital Converters (ADCs)
- Automatic Clamp Control (ACC) for CVBS, Y and C (or VSB) and component signals
- · Switchable white peak control
- Four 9-bit low noise CMOS ADCs running at twice the oversampling rate (27 MHz)
- Fully programmable static gain or Automatic Gain Control (AGC), matching to the particular signal properties
- On-chip line-locked clock generation in accordance with "ITU 601"
- Requires only one crystal (32.11 or 24.576 MHz) for all standards
- Horizontal and vertical sync detection.

Video decoder

- Digital PLL for synchronization and clock generation from all standards and non-standard video sources e.g. consumer grade VTR
- Automatic detection of any supported colour standard
- Luminance and chrominance signal processing for PAL B, G, D, H, I and N, combination PAL N, PAL M, NTSC M, NTSC-Japan, NTSC 4.43 and SECAM
- Adaptive 2/4-line comb filter for two dimensional chrominance/luminance separation, also with VTR signals
 - Increased luminance and chrominance bandwidth for all PAL and NTSC standards
 - Reduced cross colour and cross luminance artifacts
- PAL delay line for correcting PAL phase errors
- Brightness Contrast Saturation (BCS) adjustment, separately for composite and baseband signals

- User programmable sharpness control
- Detection of copy-protected signals according to the macrovision standard, indicating level of protection
- Independent gain and offset adjustment for raw data path.

Component video processing

- RGB component inputs
- Y-P_B -P_R component inputs
- Fast blanking between CVBS and synchronous component inputs
- Digital RGB to Y-C_B -C_R matrix.

Video scaler

- Horizontal and vertical downscaling and upscaling to randomly sized windows
- Horizontal and vertical scaling range: variable zoom to 1/64 (icon) (note: H and V zoom are restricted by the transfer data rates)
- Anti-alias and accumulating filter for horizontal scaling
- Vertical scaling with linear phase interpolation and accumulating filter for anti-aliasing (6-bit phase accuracy)
- Horizontal phase correct up and downscaling for improved signal quality of scaled data, especially for compression and video phone applications, with 6-bit phase accuracy (1.2 ns step width)
- Two independent programming sets for scaler part, to define two 'ranges' per field or sequences over frames
- Fieldwise switching between decoder part and expansion port (X-port) input
- Brightness, contrast and saturation controls for scaled outputs.

Vertical Blanking Interval (VBI) data decoder and slicer

• Versatile VBI-data decoder, slicer, clock regeneration and byte synchronization e.g. for World Standard Teletext (WST), North-American Broadcast Text System (NABTS), close caption, Wide Screen Signaling (WSS) etc.

Audio clock generation

- Generation of a field-locked audio master clock to support a constant number of audio clocks per video field
- Generation of an audio serial and left/right (channel)

Digital I/O interfaces

- Real-time signal port (R port), inclusive continuous line-locked reference clock and real-time status information supporting RTC level 3.1 (refer to document "RTC Functional Specification" for details)
- Bidirectional expansion port (X-port) with half duplex functionality (D1), 8-bit Y-C_B-C_R
- Output from decoder part, real-time and unscaled
- Input to scaler part, e.g. video from MPEG decoder (extension to 16-bit possible)
- Video image port (I-port) configurable for 8-bit data (extension to 16-bit possible) in master mode (own clock), or slave mode (external clock), with auxiliary timing and handshake signals
- · Discontinuous data streams supported
- 32-word ' 4-byte FIFO register for video output data
- 28-word ' 4-byte FIFO register for decoded VBI-data output
- Scaled 4:2:2, 4:1:1, 4:2:0, 4:1:0 Y-C_B-C_R output
- Scaled 8-bit luminance only and raw CVBS data output
- · Sliced, decoded VBI-data output.

Miscellaneous

- Power-on control
- 5 V tolerant digital inputs and I/O ports
- Software controlled power saving standby modes supported
- Programming via serial I 2 C-bus, full read back ability by an external controller, bit rate up to 400 kbits/s
- Boundary scan test circuit complies with the "IEEE Std. 1149.b1 1994"
- · BGA156 package.

12.22.3. Pinning

SYMBOL	PIN	TYPE	DESCRIPTION			
XTOUT	A2	0	crystal oscillator output signal; auxiliary signal			
XTALO	A3	0	24.576 MHz (32.11 MHz) crystal oscillator output; not			
			connected if TTL clock input of XTALI is used			
V _{SS(xtal)}	A4	P	ground for crystal oscillator			
TDO	A5	0	test data output for boundary scan test; note 2			
XRDY	A6	0	task flag or ready signal from scaler, controlled by XRQT			
XCLK	A7	I/O	clock I/O expansion port			
XPD0	A8	I/O	LSB of expansion port data			
XPD2	A9	I/O	MSB - 5 of expansion port data			
XPD4	A10	I/O	MSB - 3 of expansion port data			
XPD6	A11	I/O	MSB - 1 of expansion port data			
TEST1	A12	I/pu	do not connect, reserved for future extensions and for testing			
			scan input			
TEST2	A13	I/pu	do not connect, reserved for future extensions and for testing scan input			
Al41	B1		analog input 41			
TEST3	B2	0	do not connect, reserved for future extensions and for testing			
V _{DD(xtal)}	B3	Р	supply voltage for crystal oscillator			
XTALI	B4		input terminal for 24.576 MHz (32.11 MHz) crystal oscillator			
	/		or connection of external oscillator with TTL compatible square wave clock signal			
TDI	DE.	I/nu				
TDI	B5	I/pu	test data input for boundary scan test; note 2			
TCK	B6	I/pu	test clock for boundary scan test; note 2			
XDQ	B7	I/O	data qualifier for expansion port			
XPD1	B8	I/O	MSB - 6 of expansion port data			
XPD3	B9	I/O	MSB - 4 of expansion port data			
XPD5	B10	I/O	MSB - 2 of expansion port data			
XTRI	B11		X-port output control signal, affects all X-port pins (XPD7 to XPD0, XRH, XRV, XDQ and XCLK), enable and active polarity is under software control (bits XPE in subaddress 83H)

AMCLK	P11	0	audio master clock output, up to 50% of crystal clock
ALRCLK	P12	O/st/pd	audio left/right clock output; can be strapped to supply via a 3.3 kW resistor to indicate that the default 24.576 MHz crystal (ALRCLK = 0; internal pull-down) has been replaced by a 32.110 MHz crystal (ALRCLK = 1); see notes 5 and 7
TEST19	P13	I/pu	do not connect, reserved for future extensions and for testing: scan input

Notes

- 1. I = input, O = output, P = power, NC = not connected, st = strapping, pu = pull-up, pd = pull-down, od = open-drain.
- 2. In accordance with the "IEEE1149.1" standard the pads TDI, TMS, TCK and TRST are input pads with an internal pull-up transistor and TDO is a 3-state output pad.
- 3. For board design without boundary scan implementation connect the TRST pin to ground.
- 4. This pin provides easy initialization of the Boundary Scan Test (BST) circuit. TRST can be used to force the Test Access Port (TAP) controller to the TEST_LOGIC_RESET state (normal operation) at once.
- 5. Pin strapping is done by connecting the pin to the supply via a 3.3 $\kappa\Omega$ resistor. During the power-up reset sequence the corresponding pins are switched to input mode to read the strapping level. For the default setting no strapping

resistor is necessary (internal pull-down).

- 6. Pin RTCO operates as I 2 C-bus slave address pin; RTCO = 0 slave address 42H/43H (default); RTCO = 1 slave address 40H/41H.
- 7. Pin ALRCLK: 0 = 24.576 MHz crystal (default; Philips order number 4322 143 05291); 1 = 32.110 MHz crystal

12.23. TPS72501

12.23.1. General Description

The TPS725xx family of 1-A low-dropout (LDO) linear regulators has fixed voltage options available that are commonly used to power the latest DSPs, FPGAs, and microcontrollers. An adjustable option ranging from 1.22 V to 5.5 V is also available. The integrated supervisory circuitry provides an active low RESET signal when the output falls out of regulation. The no capacitor/any capacitor feature allows the customer to tailor output transient performance as needed. Therefore, compared to other regulators capable of providing the same output current, this family of regulators can provide a stand alone power supply solution or a post regulator for a switch mode power supply.

These regulators are ideal for higher current applications. The family operates over a wide range of input voltages (1.8 V to 6 V) and has very low dropout (170 mV at 1-A).

Ground current is typically 210 μA at full load and drops to less than 80 μA at no load. Standby current is less than 1 μA .

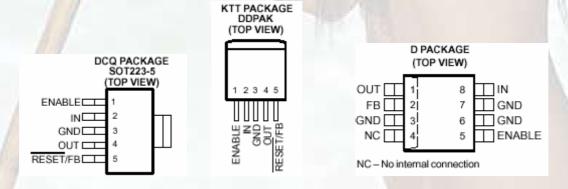

Each regulator option is available in either a SOT223–5, D (TPS72501 only), or DDPAK package. With a low input voltage and properly heatsinked package, the regulator dissipates more power and achieves higher efficiencies than similar regulators requiring 2.5 V or more minimum input voltage and higher quiescent currents. These features make it a viable power supply solution for portable, battery powered equipment.

Although an output capacitor is not required for stability, transient response and output noise are improved with a 10-µF output capacitor.

Unlike some regulators that have a minimum current requirement, the TPS725 family is stable with no output load current. The low noise capability of this family, coupled with its high current operation and ease of power dissipation, make it ideal for telecom boards, modem banks, and other noise sensitive applications.

12.23.2. Features

- 1-A Output Current
- Available in 1.5-V, 1.6-V, 1.8-V, 2.5-V Fixed-Output and Adjustable Versions (1.2-V to 5.5-V)
- Input Voltage Down to 1.8 V
- Low 170-mV Dropout Voltage at 1 A (TPS72525)
- Stable With Any Type/Value Output Capacitor
- Integrated Supervisor (SVS) With 50-ms RESET Delay Time
- Low 210-µA Ground Current at Full Load (TPS72525)
- Less than 1-µA Standby Current
- ±2% Output Voltage Tolerance Over Line, Load, and Temperature (-40C to 125C)
- Integrated UVLO
- Thermal and Overcurrent Protection
- 5-Lead SOT223-5 or DDPAK and 8-Pin SOP (TPS72501 only) Surface Mount Package

12.24. TSOP1836

12.24.1. Description

The TSOP18.. – series are miniaturized receivers for infrared remote control systems. PIN diode and preamplifier are assembled on lead frame, the epoxy package is designed as IR filter. Carrier frequency for TSOP1836 is 36kHz.

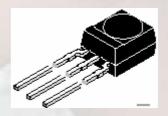

The demodulated output signal can directly be decoded by a microprocessor. The main benefit is the reliable function even in disturbed ambient and the protection against uncontrolled output pulses.

12.24.2. Features

- Photo detector and preamplifier in one package
- Internal filter for PCM frequency
- TTL and CMOS compatibility
- Output active low
- Improved shielding against electrical field disturbance
- Suitable burst length .6 cycles/burst

Special Features

- Small size package
- Enhanced immunity against all kinds of disturbance light

- No occurrence of disturbance pulses at the output
- Short settling time after power on (<200 s)

12.25. PCF8591

12.25.1. General Description

The PCF8591 is a single-chip, single-supply low power 8-bit CMOS data acquisition device with four analog inputs, one analog output and a serial I²C-bus interface.

Three address pins A0, A1 and A2 are used for programming the hardware address, allowing the use of up to eight devices connected to the I²C-bus without additional hardware. Address, control and data to and from the device are transferred serially via the two-line bidirectional I²C-bus.

The functions of the device include analog input multiplexing, on-chip track and hold function, 8-bit analog-to-digital conversion and an 8-bit digital-to-analog conversion. The maximum conversion rate is given by the maximum speed of the I²C-bus.

12.25.2. Features

- Single power supply
- Operating supply voltage 2.5 V to 6 V
- Low standby current
- Serial input/output via I 2 C-bus
- Address by 3 hardware address pins
- Sampling rate given by I 2 C-bus speed
- 4 analog inputs programmable as single-ended or differential inputs
- Auto-incremented channel selection
- Analog voltage range from vss to vdd
- On-chip track and hold circuit
- 8-bit successive approximation A/D conversion
- Multiplying DAC with one analog output.

12.25.3. Pinning

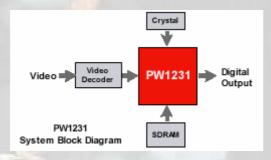

SYMBOL	PIN	DESCRIPTION
AINO	1	analog inputs (A/D converter)
AIN1	2	
AIN2	3	
AIN3	4	
A0	5	hardware address
A1	6	
A2	7	
V _{SS}	8	negative supply voltage
SDA	9	I ² C-bus data input/output
SCL	10	I ² C-bus clock input
OSC	11	oscillator input/output
EXT	12	external/internal switch for oscillator input
AGND	13	analog ground
V_{REF}	14	voltage reference input
AOUT	15	analog output (D/A converter)
V_{DD}	16	positive supply voltage

12.26. PW1231

12.26.1. General Description

The PW1231 is a high-quality, digital video signal processor that incorporates Pixelworks' patented deinterlacing, scaling, and video enhancement algorithms. The PW1231 accepts industry-standard video formats and resolutions, and converts the input into any desired output format. The video algorithms are highly efficient, providing excellent quality video.

The PW1231 Video SignalProcessor combines many functions into a single device, including memory controller, auto-configuration, and others. This high level of integration enables simple, flexible, cost-effective solutions featuring fewer required components.

12.26.2. Features

- Built-In Memory Controller
- Motion-Adaptive Deinterlace Processor
- Intelligent Edge Deinterlacing
- Digital Color/Luminance Transient Improvement (DCTI/DLTI)
- Interlaced Video Input Options, including NTSC and PAL
- Independent horizontal and vertical scaling
- Copy Protection
- Two-Wire Serial Interface

12.26.3. Applications

For use with Digital Displays

- Flat-Panel (LCD, DLP) TVs
- Rear Projection TVs
- Plasma Displays
- LCD Multimedia Monitors
- Multimedia Projectors

12.27. PW181

12.27.1. General Description

The PW181 ImageProcessor is a highly integrated "system-on-a-chip" that interfaces computer graphics and video inputs in virtually any format to a fixed-frequency flat panel display.

Computer and video images from NTSC/PAL to WUXGA at virtually any refresh rate can be resized to fit on a fixed-frequency target display device with any resolution up to WUXGA. Video data from 4:3 aspect ratio NTSC or PAL and 16:9 aspect ratio HDTV or SDTV is supported. Multi-region, nonlinear scaling allows these inputs to be resized optimally for the native resolution of the display.

Advanced scaling techniques are supported, such as format conversion using multiple programmable regions. Three independent image scalers coupled with frame locking circuitry and dual programmable color lookup tables create sharp images in multiple windows, without user intervention.

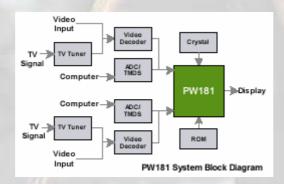

Embedded SDRAM frame buffers and memory controllers perform frame rate conversion and enhanced video processing completely on-chip. A separate memory is dedicated to storage of on-screen display images and CPU general purpose use.

Advanced video processing techniques are supported using the internal frame buffer, including motion adaptive, temporal deinterlacing with film mode detection. When used in combination with the new third-generation scaler, this advanced video processing technology delivers the highest quality video for advanced displays.

Both input ports support integrated DVI 1.0 content protection using standard DVI receivers.

A new advanced OSD Generator with more colors and larger sizes supports more demanding OSD applications, such as on-screen programming guides. When coupled with the new, faster, integrated microprocessor, this OSD Generator supports advanced OSD animation techniques.

Programmable features include the user interface, custom start-up screen, all automatic imaging features, and special screen effects.

12.27.2. Features

- Third-generation, two-dimensional filtering techniques
- Third-generation, advanced scaling techniques
- Second-generation Automatic Image Optimization
- Frame rate conversion
- Video processing
- On-Screen Display (OSD)
- On-chip microprocessor
- JTAG debugger and boundary scan
- Picture-in-picture (PIP)
- Multi-region, non-linear scaling
- Hardware 2-wire serial bus support

12.27.3. Applications

- Multimedia Displays
- Plasma Displays
- Digital Television

12.28, SIL151B

12.28.1. General Description

The SiI 151B receiver uses PanelLink Digital technology to support high-resolution displays up to SXGA (25-112MHz). This receiver supports up to true color panels (24 bit/pixel, 16M colors) with both one and two pixels per clock.

All PanelLink products are designed on a scaleable CMOS architecture, ensuring support for future performance enhancements while maintaining the same logical interface. System designers can be assured that the interface will be stable through a number of technology and performance generations. PanelLink Digital technology simplifies PC and display interface design by resolving many of the system level issues associated with high-speed mixed signal design, providing the system designer with a digital interface solution that is quicker to market and lower in cost.

12.28.2. Features

- Low Power Operation: 201mA max. current consumption at 3.3V core operation
- Time staggered data output for reduced ground bounce and lower EMI
- Sync Detect feature for Plug & Display iMHot Plugginglo
- Cable Distance Support: over 5m with twisted-pair, fiber-optics ready
- Compliant with DVI 1.0 (DVI is backwards compatible with VESA ® P&D ™ and DFP)
- HSYNC de-jitter circuitry enables stable operation even when HSYNC contains jitter
- Low power standby mode
- Automatic entry into standby mode with clock detect circuitry
- Standard and Pb-free packages

12.29. SDRAM 4M x 16 (MT48LC4M16A2TG-75)

12.29.1. General Description

The Micron ® 64Mb SDRAM is a high-speed CMOS, dynamic random-access memory containing 67,108,864 bits. It is internally configured as a quad-bank DRAM with a synchronous interface (all signals are registered on the positive edge of the clock signal, CLK). Each of the x4's 16,777,216-bit banks is organized as 4,096 rows by 1,024 columns by 4 bits. Each of the x8's 16,777,216-bit banks is organized as 4,096 rows by 512 columns by 8 bits. Each of the x16's 16,777,216- bit banks is organized as 4,096 rows by 256 columns by 16 bits.

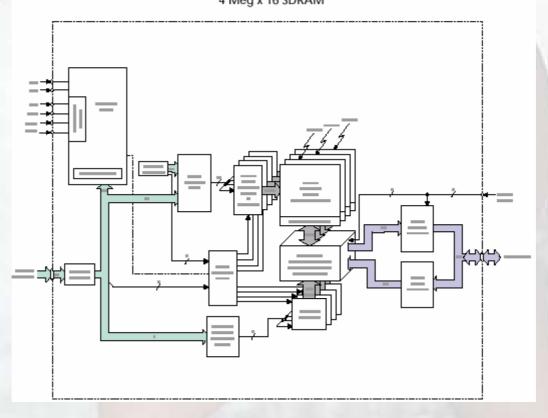

Read and write accesses to the SDRAM are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the bank and row to be accessed (BAO, BA1 select the bank; A0-A11 select the row). The address bits registered coincident with the READ or WRITE command are used to select the starting column location for the burst access. The SDRAM provides for programmable READ or WRITE burst lengths of 1, 2, 4, or 8 locations, or the full page, with a burst terminate option. An auto precharge function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence.

The 64Mb SDRAM uses an internal pipelined architecture to achieve high-speed operation. This architecture is compatible with the 2n rule of prefetch architectures, but it also allows the column address to be changed on every clock cycle to achieve a high-speed, fully random access. Precharging one bank while accessing one of the other three banks will hide the precharge cycles and provide seamless, high-speed, random-access operation.

The 64Mb SDRAM is designed to operate in 3.3V memory systems. An auto refresh mode is provided, along with a power-saving, power-down mode. All inputs and outputs are LVTTL-compatible.

SDRAMs offer substantial advances in DRAM operating performance, including the ability to synchronously burst data at a high data rate with automatic column-address generation, the ability to interleave between internal banks in order to hide precharge time and the capability to randomly change column addresses on each clock cycle during a burst access.

FUNCTIONAL BLOCK DIAGRAM 4 Meg x 16 SDRAM

12.29.2. Features

- PC66-, PC100-, and PC133-compliant
- Fully synchronous; all signals registered on positive edge of system clock
- Internal pipelined operation; column address can be changed every clock cycle
- Internal banks for hiding row access/precharge
- Programmable burst lengths: 1, 2, 4, 8, or full page
- Auto Precharge, includes CONCURRENT AUTO PRECHARGE, and Auto Refresh Modes
- Self Refresh Modes: standard and low power
- 64ms, 4,096-cycle refresh
- LVTTL-compatible inputs and outputs
- Single +3.3V ±0.3V power supply

12.29.3. Pin Descriptions

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
38	CLK	Input	Clock: CLK is driven by the system clock. All SDRAM input signals are sampled on the positive edge of CLK. CLK also increments the internal burst counter and controls the output registers.
37	CKE	Input	Clock Enable: CKE activates (HIGH) and deactivates (LOW) the CLK signal. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), ACTIVE POWER-DOWN (row active in any bank) or CLOCK SUSPEND operation (burst/access in progress). CKE is synchronous except after the device enters power-down and self refresh modes, where CKE becomes asynchronous until after exiting the same mode. The input buffers, including CLK, are disabled during power-down and self refresh modes, providing low standby power. CKE may be tied HIGH.
19	CS#	Input	Chip Select: CS# enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when CS# is registered HIGH. CS# provides for external bank selection on systems with multiple banks. CS# is considered part of the command code.
16, 17, 18	WE#, CAS#,	Input	Command Inputs: WE#, CAS#, and RAS# (along with CS#) define the command being entered.
39	x4, x8: DQM	Input	Input/Output Mask: DQM is an input mask signal for write accesses and an output enable signal for read accesses. Input data is masked when DQM is sampled HIGH during a WRITE cycle. The output buffers are placed in a High-Z state (two-clock latency) when DQM is sampled HIGH during a READ
15, 39	x16: DQML, DQMH		cycle. On the x4 and x8, DQML (Pin 15) is a NC and DQMH is DQM. On the x16, DQML corresponds to DQ0-DQ7 and DQMH corresponds to DQ8-DQ15. DQML and DQMH are considered same state when referenced as DQM.
20, 21	BA0, BA1	Input	Bank Address Inputs: BA0 and BA1 define to which bank the ACTIVE, READ, WRITE or PRECHARGE command is being applied.
23-26, 29-34, 22, 35	A0-A11	Input	Address Inputs: A0-A11 are sampled during the ACTIVE command (row-address A0-A11) and READ/WRITE command (column-address A0-A9 [x4]; A0-A8 [x8]; A0-A7 [x16]; with A10 defining auto precharge) to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine if all banks are to be precharged (A10[HIGH]) or bank selected by BA0, BA1 (A1[LOW]). The address inputs also provide the op-code during a LOAD MODE REGISTER command.
2, 4, 5, 7, 8, 10, 11, 13, 42, 44, 45, 47, 48, 50, 51, 53	DQ0-DQ15	x16: I/O	Data Input/Output: Data bus for x16 (4, 7, 10, 13, 42, 45, 48, and 51 are NCs for x8; and 2, 4, 7, 8, 10, 13, 42, 45, 47, 48, 51, and 53 are NCs for x4).
2, 5, 8, 11, 44, 47, 50, 53	DQ0-DQ7	x8: I/O	Data Input/Output: Data bus for x8 (2, 8, 47, 53 are NCs for x4).
5, 11, 44, 50	DQ0-DQ3	x4: I/O	Data Input/Output: Data bus for x4.
40	NC	-	No Connect: These pins should be left unconnected.

36	NC	_	Address input (A12) for the 256Mb and 512Mb devices
3, 9, 43, 49	$V_{DD}Q$	Supply	DQ Power: Isolated DQ power on the die for improved noise
			immunity.
6, 12, 46, 52	V _{SS} Q	Supply	DQ Ground: Isolated DQ ground on the die for improved noise
			immunity.
1, 14, 27	V _{DD}	Supply	Power Supply: +3.3V ±0.3V.
28, 41, 54	Vss	Supply	Ground.

12.30. FLASH 8MBit

12.30.1. Description

The M29W800A is a non-volatile memory that may be erased electrically at the block or chip level and programmed in-system on a Byte-by-Byte or Word-by-Word basis using only a single 2.7V to 3.6V $V_{\rm CC}$ supply. For Program and Erase operations the necessary high voltages are generated internally. The device can also be programmed in standard programmers.

The array matrix organization allows each block to be erased and reprogrammed without affecting other blocks. Blocks can be protected against programming and erase on programming equipment, and temporarily unprotected to make changes in the application. Each block can be programmed and erased over 100,000 cycles.

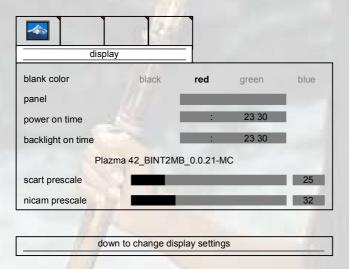

Instructions for Read/Reset, Auto Select for reading the Electronic Signature or Block Protection status, Programming, Block and Chip Erase, Erase Suspend and Resume are written to the device in cycles of commands to a Command Interface using standard microprocessor write timings.

12.30.2. Features

- 2.7V to 3.6V Supply Voltage for Program, Erase and Read Operations
- Access Time: 80ns
- Programming Time: 10µs typical
- Program/Erase Controller (P/E.C.)
- Program Byte-by-Byte or Word-by-Word
- Status Register bits and Ready/Busy Output
- Security Protection Memory Area
- Instruction Address Coding: 3 Digits
- Memory Blocks
- Boot Block (Top or Bottom location)
- Parameter and Main blocks
- · Block, Multi-Block and Chip Erase
- Multi Block Protection/Temporary Unprotection Modes
- Erase Suspend and Resume Modes
- Read and Program another Block during Erase Suspend
- Low Power Consumption
- Stand-by and Automatic Stand-by
- 100,000 Program/Erase Cycles per Block
- 20 Years Data Retention
- Defectivity below 1ppm/year
- Electronic Signature
- Manufacturer Code: 20h
- Top Device Code, M29W800AT: D7h
- Bottom Device Code, M29W800AB: 5Bh

13. SERVICE MENU SETTINGS

All system, geometry and white balance alignments are performed in production service mode. Before starting the production mode alignments, make sure that all manual adjustments are done correctly. To start production mode alignments enter the MENU by pressing "**M** (**MENU**)" button and then press the digits 4, 7, 2 and 5 respectively. The following menu appears on the screen.

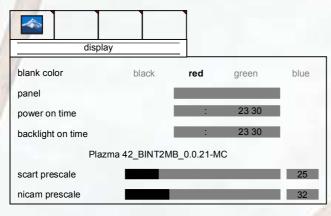

There are 4 submenus in service menu. These are display, calibration, deinterlacer and factory settings menus. Press " $\blacktriangleleft/\triangleright$ " buttons to select a menu title and then " $\blacktriangle/\triangleright$ " buttons to select a menu item and " $\blacktriangleleft/\triangleright$ " or " \bullet K" buttons to set the menu item to the desired option. To exit the service menu press "M" button.

Entire service menu parameters of Plasma TV are listed below.

13.1. display menu

By pressing "◀/▶" buttons select the first icon. **display** menu appears on the screen.

down to change display settings

blank color

By pressing ▲/▼ button, select **blank color**. Press **◄/▶** button to set the blank color. The options are: **black**, **red**, **green** and **blue**.

panel

Displays panel resolution.

power on time

Displays total working time of the set.

backlight on time

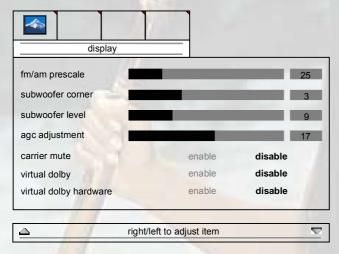

Displays total backlight on time of the set. (Not used for plasma displays)

scart prescale

By pressing ▲/▼ button, select scart prescaler. Press ◀/▶ button to set the scart prescaler. Scart prescale can be adjusted between 0 and 127.

nicam prescale

By pressing ▲/▼ button, select **nicam prescaler**. Press ◀/▶ button to set the nicam prescaler. Nicam prescale can be adjusted between 0 and 127.

fm/am prescale

By pressing ▲/▼ button, select **fm/am prescaler**. Press ◀/▶ button to set the fm/am prescaler. Fm/am prescale can be adjusted between 0 and 127.

subwoofer corner

By pressing ▲/▼ button, select **subwoofer corner**. Press **◄/▶** button to set the subwoofer corner. Subwoofer corner can be adjusted between 0 and 7.

subwoofer level

By pressing ▲/▼ button, select **subwoofer level**. Press **◄/▶** button to set the subwoofer level. Subwoofer level can be adjusted between 0 and 32.

agc adjustment

Adjustment for automatic gain control of tuner. By pressing ▲/▼ button, select **agc adjustment**. Press ◄/▶ button to set the agc adjustment. Agc adjustment can be adjusted between 0 and 31.

carrier mute

By pressing ▲/▼ button, select **carrier mute**. Press **◄/▶** button to enable or disable the sound carrier mute feature.

virtual dolby

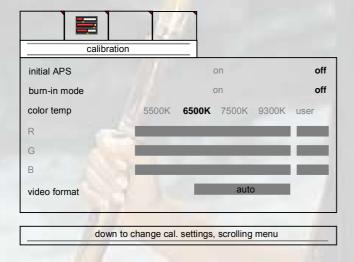

By pressing ▲/▼ button, select **virtual dolby**. Press ◀/▶ button to enable or disable the virtual dolby feature in the audio menu of the TV.

virtual dolby hardware

By pressing ▲/▼ button, select **virtual dolby hardware**. Press ◀/▶ button to enable or disable the virtual dolby hardware feature of the TV.

13.2. calibration menu

By pressing "◄/▶" buttons select the second icon. **calibration** menu appears on the screen.

initial APS

By pressing △/▼ button, select **initial APS**. Initial APS can be selected **on** or **off**. If initial aps is switched **on**, then the TV will display initial APS menu only for the first time it is switched on.

burn-in mode

By pressing ▲/▼ button, select burn-in mode. Press ◀/▶ button to set it on or off.

color temp

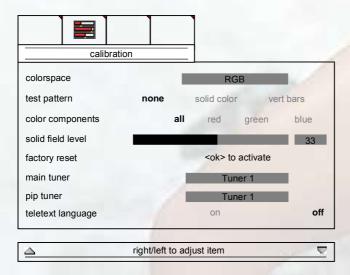

By pressing ▲/▼ button, select color temp. Press ◄/▶ button to set the color temperature. The options are: 5500K, 6500K, 7500K, 9300K and user.

R/G/B

If color temp is set as "user", then R/G/B settings can be adjusted. By pressing ▲/▼ button, select Red, Green or Blue. Press ▶ button to increase the color value. Press ◀ button to decrease the color value. R/G/B values can be adjusted between 0 and 63.

video format

By pressing ▲/▼ button, select **video format**. Press **◄/▶** button to set the **video format**. The options are: **auto**, **ntsc**, **pal**, **secam** and **ntsc japan**.

color space

Displays the current color space used. RGB, YPbPr SMPTE240, YPbPr REC709 and YCbCr REC601.

test pattern

By pressing ▲/▼ button, select **test pattern**. Press ◄/▶ button to set the test pattern. The options are: **none**, **solid color** and **vert bars**.

color components

By pressing ▲/▼ button, select **color components**. Press **◄/▶** button to set the color components. The options are: **all**, **red**, **green** and **blue**.

solid field level

By pressing ▲/▼ button, select **solid field level**. Press ▶ button to increase or ◀ button to decrease the solid field level. Solid field level can be adjusted between 0 and 64.

factory reset

By pressing ▲/▼ button, select factory reset. Press "OK" button to return to the factory setting values.

main tuner

By pressing ▲/▼ button, select main tuner. Press ◄/▶ button to set a tuner as main tuner.

pip tunei

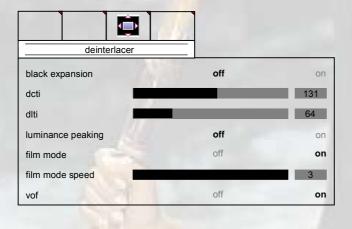

By pressing ▲/▼ button, select **pip tuner**. Press **◄/**▶ button to set a tuner as pip tuner.

teletext language

By pressing ▲/▼ button, select **teletext language**. Press ◀/▶ button to set it on or off. When it is turned on, the teletext language option can be seen in the TV menu.

13.3. deinterlacer menu

By pressing "◄/▶" buttons select the third icon. **deinterlacer** menu appears on the screen.

down for deinterlacer settings, scrolling menu

black expansion

By pressing ▲/▼ button, select **black expansion**. Black expantion can be set to **on** or **off** by pressing ◀/▶ button.

dcti

Digital colour transition improvement: By pressing ▲/▼ button, select **dcti**. DCTI can be adjusted between **0** and **255** by pressing ◀/▶ button.

dlti

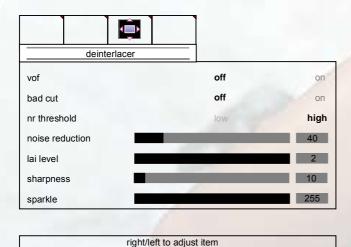

Digitial luma transition improvement: By pressing ▲/▼ button, select **dlti**. DLTI can be adjusted between **0** and **255** by pressing **◄/**▶ button.

luminance peaking

By pressing ▲/▼ button, select **luminance peaking**. Luminance peaking can be set to **on** or **off** by pressing ◀/▶ button.

film mode

By pressing ▲/▼ button, select **film mode**. Film mode speed can be set to **on** or **off** by pressing ◀/▶ button.

film mode speed

By pressing ▲/▼ button, select **film mode speed**. Film mode speed can be set to **0**, **1**, **2** or **3** by pressing ◀/▶ button.

vof

video on film. By pressing ▲/▼ button, select **vof**. VOF can be set to **on** or **off** by pressing **◄/▶** button.

bad cut

By pressing ▲/▼ button, select **vof**. Bad cut can be set to **on** or **off** by pressing **◄/▶** button.

nr threshold

By pressing ▲/▼ button, select **nr threshold**. Nr threshold can be set to **low** or **high** by pressing ◀/▶ button.

noise reduction

By pressing ▲/▼ button, select **noise reduction**. Noise reduction can be adjusted between **0** and **255** by pressing ◀/▶ button.

lai level

By pressing ▲/▼ button, select lai level. Lai level can be set to 0, 1 or 2 by pressing ◄/▶ button.

sharpness

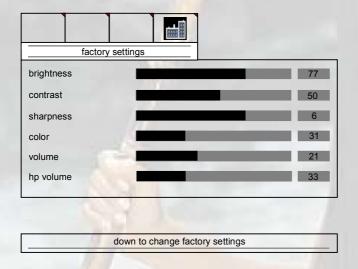

By pressing ▲/▼ button, select **sharpness**. Sharpness can be adjusted between **0** and **255** by pressing ◀/▶ button.

sparkle

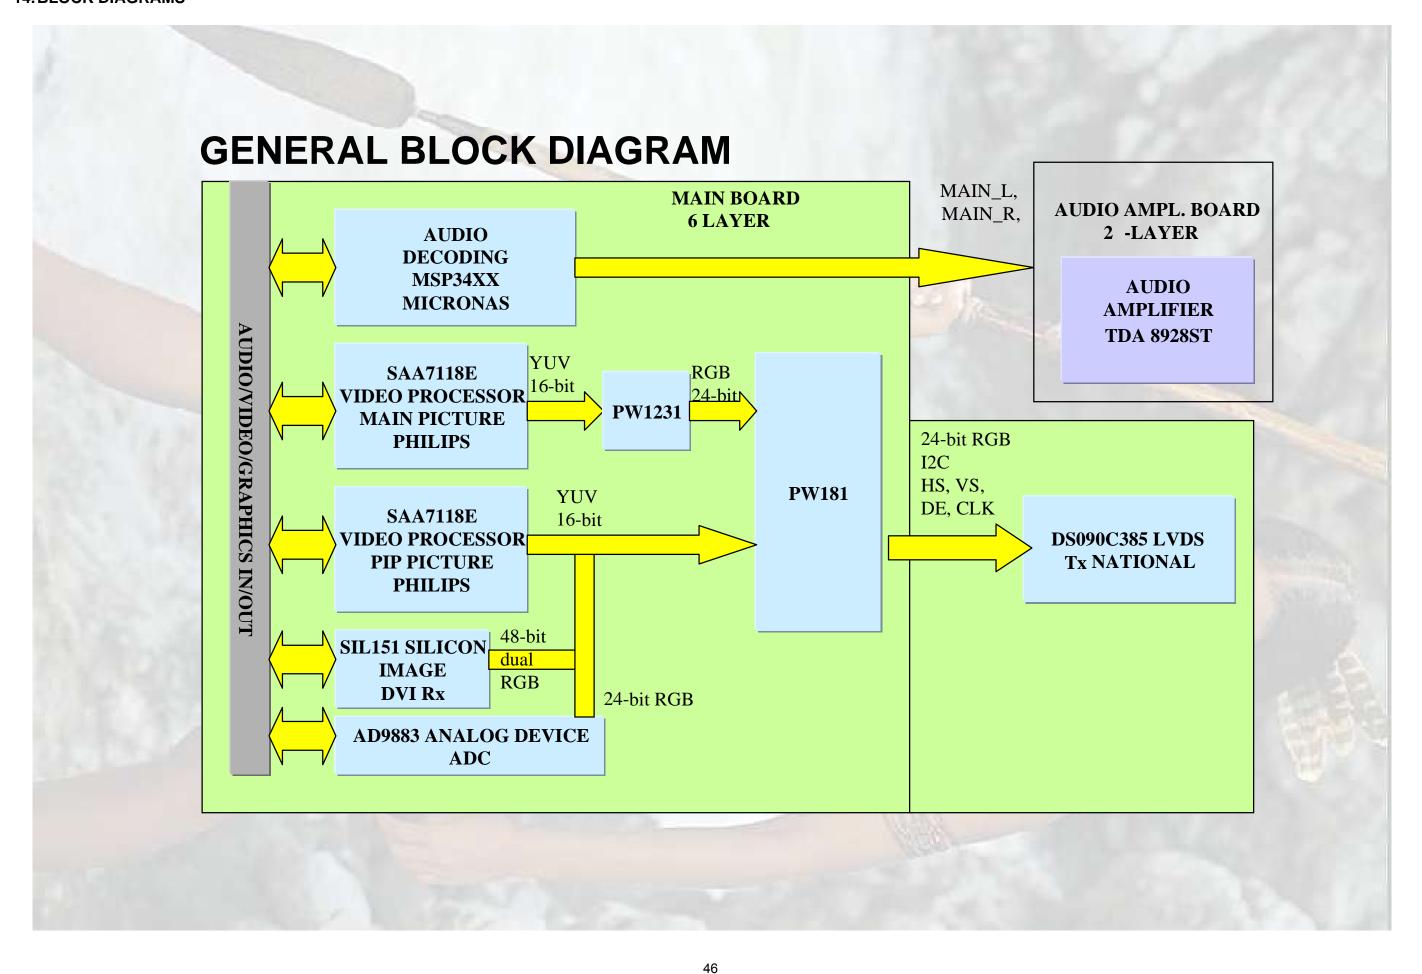

By pressing ▲/▼ button, select **sparkle**. Sparkle can be adjusted between **0** and **255** by pressing ◀/▶ button.

13.4. factory settings menu

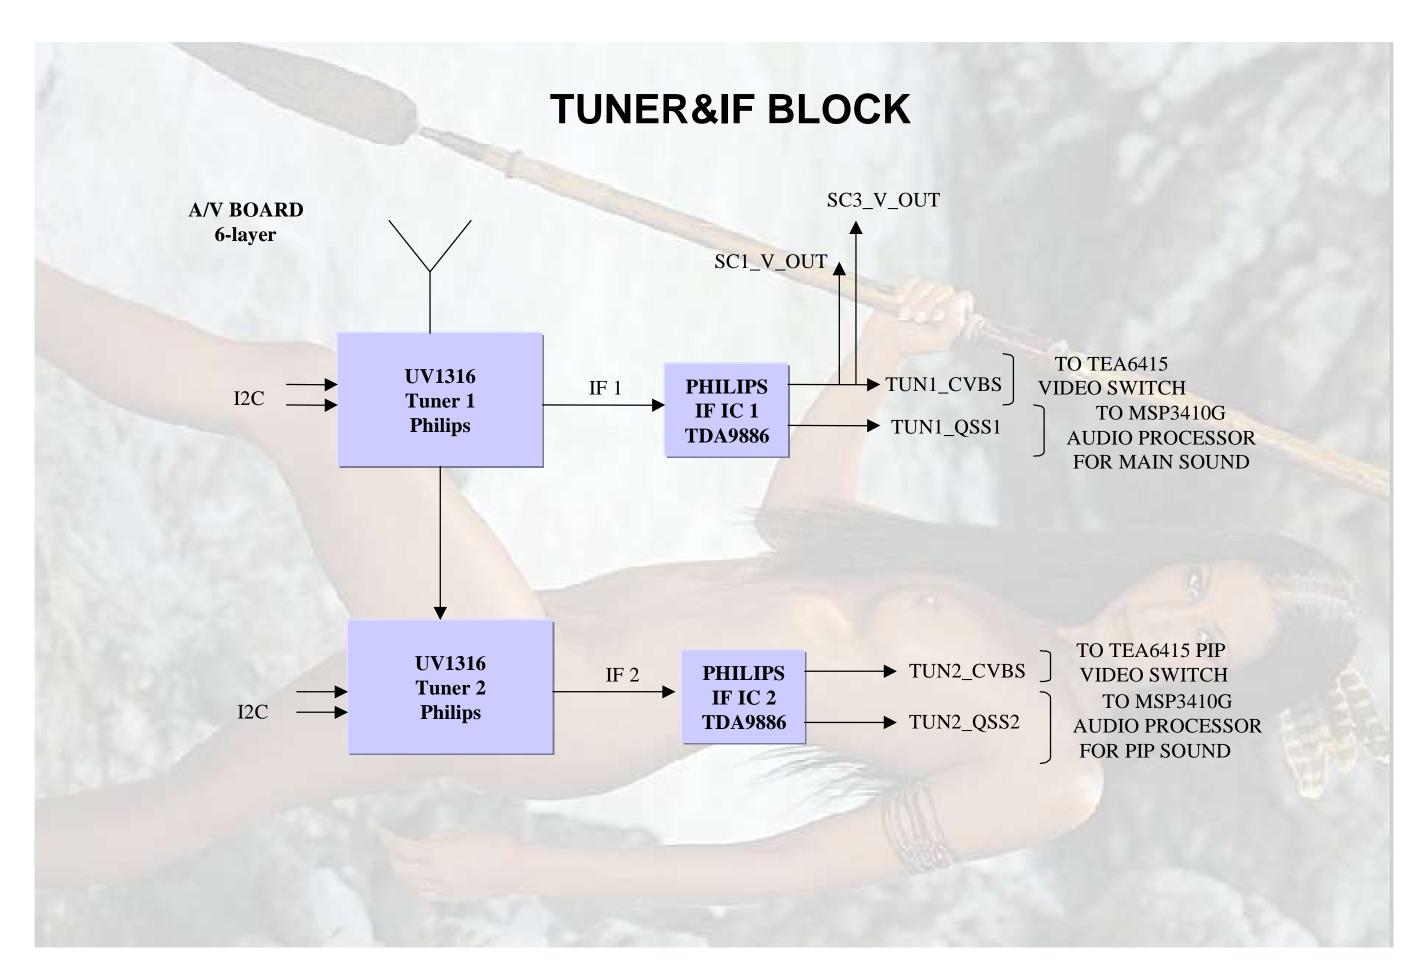

By pressing "◄/▶" buttons select the fourth icon. **Factory settings** menu appears on the screen.

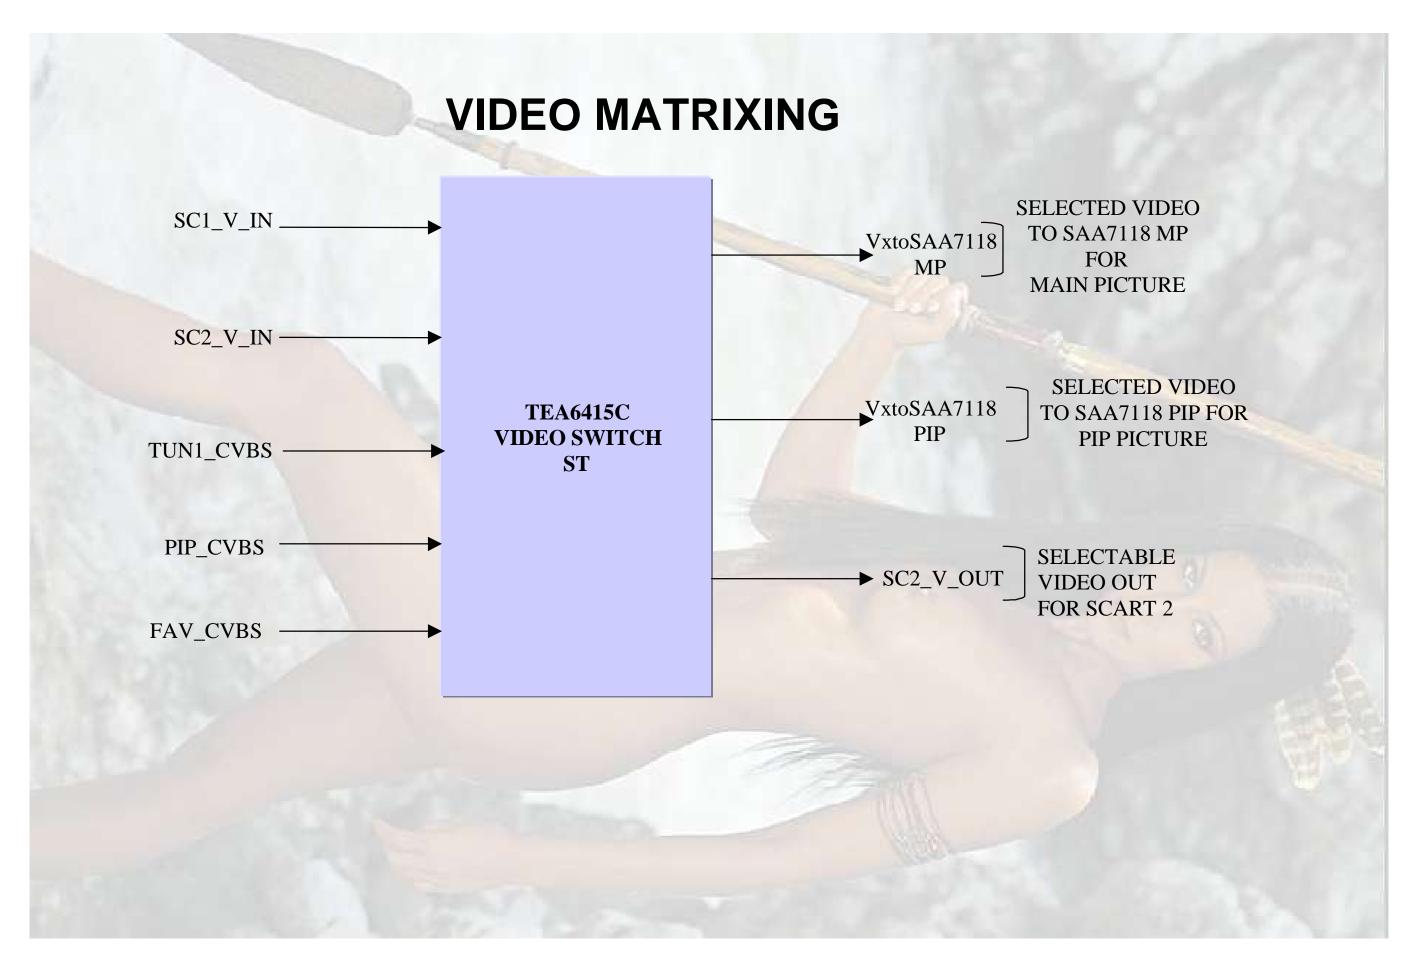

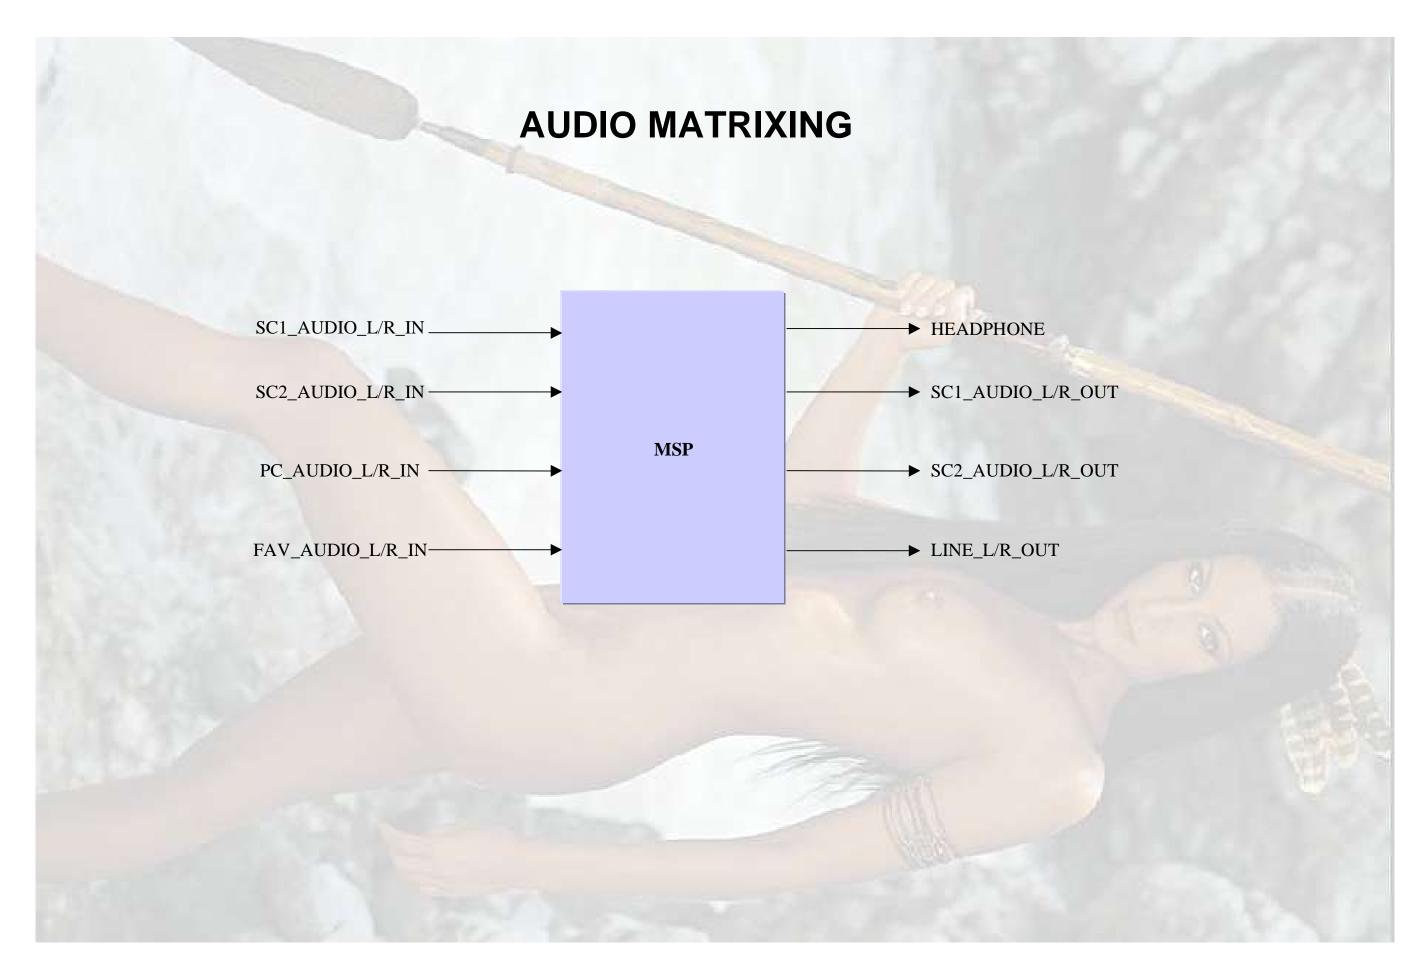

Brightness, contrast, sharpness, color, volume and headphone volume factory settings can be seen in this menu. When factory reset is selected in the calibration menu, the values in the factory settings menu will be seen in the TV menus.
