TECHNICAL SERVICE MANUAL

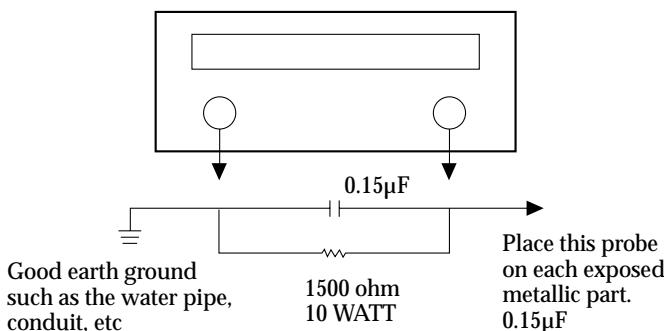

Safety Precaution

WARNING

Service should not be attempted by anyone unfamiliar with the necessary precautions on this monitor. The followings are the necessary precautions to be observed before servicing.

1. Always discharge the high voltage to the CRT conductive coating before handling the CRT. The picture tube is highly evacuated and if broken, glass fragments will be violently exploded. Use shatter proof goggles and keep picture tube away from the bare body while handling.
2. When replacing a chassis in the cabinet, always be certain that all the protective devices are put back in place, such as nonmetallic control knobs, insulating covers, shields, isolation resistor capacitor network etc.
3. Before returning the monitor to the customer, always perform an AC leakage current check on the exposed metallic parts of the cabinet, such as signal connectors, terminals, screw heads, metal overlays, control shafts etc, to be sure the monitor is safe to operate without danger of electrical shock. Plug the AC line cord directly into a AC outlet (do not use a line isolation trasformer during this check.). Use an AC voltmeter having 1500 ohm per volt or more sensitivity in the following manner : Connect ground(water pipe, conduit, etc.) and the exposed metallic parts, one at a time. Measure the AC Voltage across the combination of 1500 ohm resistor and $0.15\mu F$ capacitor. Reverse the AC plug at the AC outlet and repeat AC voltage measurements for each exposed metallic part. The Voltage must not exceed 0.3 volts RMS. This corresponds to 0.2 millamp AC. Any value exceeded this limit constitutes a potential shock hazard and must be corrected immediately.

AC VOLTMETER

INSTRUCTIONS TO USER

This equipment generates and uses radio frequency energy and if not installed and used properly, that is, in strict accordance with the manufacturer's instruction, may cause interference to radio and television. It has been tested and found to comply with the limits for the specifications in Subpart J of Part 15 FCC Rules, which are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures.

- reorient the receiving antenna
- relocate the computer with respect to the receiver
- plug the computer into a different outlet so that computer and receiver are on different branch circuits.

X-Ray Radiation Precaution

1. Excessive high voltage can produce potentially hazardous X-RAY RADIATION. To avoid such hazards, the high voltage must be under the specified limit. The nominal value of the high voltage of this monitor is 26KV ±1.0KV at zero beam current(minimum brightness) under a 120V AC power source. The high voltage must not(under any circumstances) exceed 30KV. Each time a monitor requires servicing, the high voltage should be checked.
It is recommended the high voltage be recorded as a part of the service record. It is important to use an accurate and reliable high voltage meter.
2. This monitor is equipped with a protection circuit which prevents the monitor from producing excessively high voltage. Each time the monitor is serviced, the protection circuit must be checked to determine that the circuit is properly functioning.
3. The only source of X-RAY RADIATION in this monitor is the picture-tube.
For continued X-RAY RADIATION protection, the replacement tube must be exactly the same type tube as specified in the parts list.
4. Some parts in this monitor have special safety-related characteristics for X-RAY RADIATION protection.
For continued safety, parts replacement should be undertaken only after referring to the product safety notice.

PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in this monitor have special safety-related characteristics. These characteristics are often not evident from visual inspection.

Replacement parts which have these special safety characteristics are identified in this manual; electrical components having such features identified by "⚠" in the replacement parts list and schematic diagram.

For continued protection, replacement parts must be identical to those used in the original circuit. The use of substitute replacement parts which do not have the same safety characteristics as the factory recommended replacement parts shown in this service manual, may create shock, fire, X-RAY RADIATION or other hazards.

PRODUCT CDRH NOTICE

Electrical potentiometers which are marked as caution "⚠" in parts list are critical components of safety & CDRH.

Therefore, for continued protection, replacement parts must be used which is used in original PCB ASS'Y.

Cautions

Be sure to turn off the power of your computer before connecting the monitor.

Theory of Operation

1. Power Supply

The AC line voltage range is from 100V to 240V.

The SMPS has +80V, +55V, -12V, +7.0V, +14V, +5V

The conducted noise is filtered by X(CP01, CP04) and Y (CP02, CP03, CP11) capacitors and a common mode line filter (LP02).

The input rectifier (DP01 ~ DP04) converts the AC line voltage into a DC voltage to power the SMPS. The UC3843 (ICP01) drives the power FET(QP04) according to the PWM signals generated by the R_T and C_T (RP07, CP10) connected pin 4 of ICP01.

The ICP01 is an integrated current mode PWM.

It consists of an oscillator, error amplifier, current sense comparator, under voltage lock-out and an MOSFET drive stage.

The switching frequency is locked to horizontal scan frequency by horizontal flyback pulse.

When the monitor is in OFF mode with no pulsed syncs. QP05 and QP07 is turned off. The total power consumption must be less than 5W in off mode.

2. DPMS and Self test mode

The power supply supports the DPMS function. Its operation is shown in the table below.

MODE	H-SYNC	V-SYNC	BRI MCU PIN35	MCU PIN 9	MCU PIN 10	QP07	14V	7.0V	REMARK
NORMAL	O	O	CONTROL	H	H	ON	14V	7.0V

SUSPEND	O	X	0 V	L	H	OFF	0V	7.0V	
OFF	X	X	0 V	L	L	OFF	0V	2.3V	

3. Signal Processing and MCU Control

The X-TAL resonates at 12MHz.

When the H and V sync or TTL composite sync are input to MCU, MCU can measures the H and V frequency to detect the video mode.

MCU has digital to analog converter(DACS) control function like ABL, H-LIN rotation, brightness, and MCU can control , Recall, H/V-Size, H/V-Position, Pincushion/Trapezoide, Parallel/Pin Balance, H/V Moire, Color Control, Information, Language, Soft Power by I2C BUS Line.

The operation of MCU is shown in the table below.

H-FREQ (kHz)	H-LIN1 PIN 30	H-LIN2 PIN 29	H-LIN3 PIN 28	REMARK
31 < H ≤ 33	L	L	L

4. Horizontal Deflection

TDA9116 is an I^C autosync deflection controller for H/V sync and drive processing. All functions are controlled by I^C bus.

When H-Sync is applied, the internal oscillator is automatically locked.

The duty-cycle of H-output pulse Pin 8/26 is variable by frequency.

QH08 and TH01 are used to drive the H-output transistor (QH09). QH09 is turned on, it conducts current through the deflection yoke on the right hand side of the screen.

This current comes from the S correction capacitors (CH27, CH29, CH32, CH34), which have a charge equal to the effective supply voltage.

When the QH09 is opened up, the damper diode(DH12) allows current for left hand side of the screen to flow back through the deflection yoke to the S capacitors.

The flyback capacitor (CH23) determines the size and length of the flyback pulse.

The S capacitors correct outside versus center linearity in horizontal scan.

THERE FETs (QH11, QH12, QH13) select the value of S capacitors.

H-centering is controlled by a switch(SWH01). The switch selects DC offset current flow through the yoke.

A diode modulator is used to control the E-W correction and H-size. ICH01 generates the E-W parabola wave using vertical amp.

A power buffer (QH02, QH03) drives the diode modulator.

In order to keep the high voltage constant independent of the horizontal scan frequency, the supply voltage of FBT must increase with increasing scan frequency proportionally. A step-up mode DC-DC converter with PWM is used to realize this demand.

ICH01 compares high-voltage feedback with reference voltage. Its output pulse switches a FET(QH07). To adjust the high voltage, TDA9116(ICH01) has a control terminal (Pin14).

5. Vertical Deflection

In vertical section of TDA9116/TDA9302H there is auto-sync processing.

The vertical output stage consists of a power OP-AMP with extra flyback generator.

TDA4866/TDA9302(ICV01) is used as vertical output stage.

6. X-Ray Protection and Beam Current Limiting.

A failure in the horizontal scan control section could cause a dangerous situation; the high voltage might rise to an unacceptable high level. When the flyback voltage rise to unacceptable level, the pin25 of ICH01 detects these states over 6.2V TDA9116/over 8.6V TDA9116

It causes the H-drive stage and oscillator to be turned off. Then high voltage is shut down until the power switch is on.

The average anode current is measured at lower side of the High Voltage winding of the FBT. The anode current flows through Connectors(CON04.CNC01) connected ICC01(KA2500) and through RM07 Connected ICM01 Pin38. and ABL is controlled by ICC01.

7. Video Amplifier and OSD Interface

KA2500(ICC01) is a Very High Frequency video amplifier with three matched video amplifiers, OSD Contrast Control SDA, SCL,OSD Interface, OSD BLK drive controls, blanking gate and clamp gate. H-blank signal is applied to Pin 19. During blanking all three outputs are thrown to the pedestal level. An inserted H-sync is used to a clamp signal.

The signal is applied to ICC01 Pin 18.

Three OSD inputs (Pin 1,2,3 of ICC01) are TTL compatible and typical bandwidth is 80MHz.

A fast commutate pin is provided to select either the video or the OSD inputs as a source for amplification.

OSD contrast control is made by controlling simultaneously the gain of three internal variable gain amplifiers through the I^C bus interface. MTV021 is designed for monitor application to display built-in characters or fonts on to monitor screen.

The display operation occurs by transferring data and control information from the MCU to RAM through a serial data interface.

The output stage is made of 3-channel power amplifier (ICC03, LM2437). The output is capable of 40 Volts swing in less than 11 Sec?

The three cathodes are AC coupled to the video amplifiers. The DC level on each cathode is set by a cut-off amplifier and clamp diode. The value of the DC voltage is adjusted by DACS.

DESCRIPTION

The TDA9116 is a monolithic integrated circuit assembled in a 32-pin shrink dual-in-line plastic package. This IC controls all the functions related to horizontal and vertical deflection in multimode or multi-frequency computer display monitors.

The internal sync processor, combined with the powerful geometry correction block, makes the TDA9116 suitable for very high performance monitors, using few external components.

Combined with other ST components dedicated for CRT monitors (microcontroller, video preamplifier, video amplifier, OSD controller) the TDA9116 allows fully I²C bus-controlled computer display monitors to be built with a reduced number of external components.

Simplified Schematic Diagram (One Channel)

Top View

General Description

The LM2437 is an integrated high voltage CRT drive circuit designed for use in color monitor applications. The IC contains three high input impedance, wide band amplifiers which directly drive the RGB cathodes of a CRT. Each channel has its gain internally set to 14 and can drive CRT capacitive loads as well as resistive loads present in other applications, limited only by the package's power dissipation.

The IC is packaged in an industry standard 9-lead TO-220 molded plastic power package. See Thermal Considerations section.

Features

- Well matched with LM1279 video preamp
- 0V to 4.5V input range
- Stable with 0-20 pF capacitive loads and inductive peaking networks
- Convenient TO-220 staggered lead package style
- Standard LM243X Family pinout which is designed for easy PCB layout

Applications

- 1024 x 768 displays up to 85Hz refresh

GENERAL DESCRIPTION

- MTV021 is designed for monitor applications to display built-in characters or fonts onto monitor screen. The display operation occurs by transferring data and control information from the micro-controller to RAM through a serial data interface. It can execute full-screen display automatically, as well as specific functions such as character background color, bordering, shadowing, blinking, double height and width, font by font color control, frame positioning, frame size control by character height and row-to-row spacing, horizontal display resolution, full-screen erasing, fade-in/fade-out effect, windowing effect and shadowing on window.
- MTV021 provides 256 standard and 16 multi-color characters and graphic fonts for more efficacious applications. The full OSD menu is formed by 15 rows x30 columns, which can be positioned anywhere on the monitor screen by changing vertical or horizontal delay
- Moreover, MTV021 also provides 8 PWM DAC channels with 8-bit resolution and a PWM clock output for external digital-to-analog control.

VSS	O	16	20	24	Digital ground. This ground pin is used to internal digital circuitry.

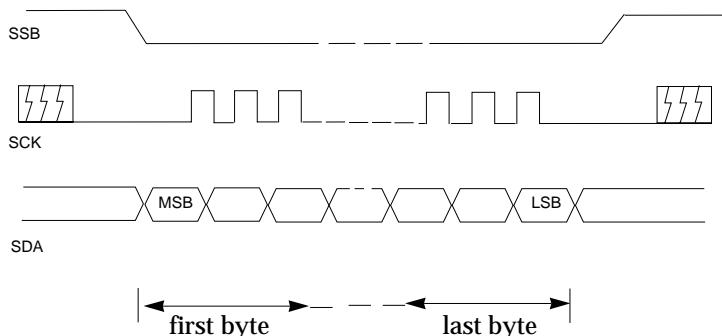

FUNCTIONAL DESCRIPTIONS

SERIAL DATA INTERFACE

The serial data interface receives data transmitted from an external controller. And there are 2 types of bus can be accessed through the serial data interface, one is SPI bus and other is I²C bus.

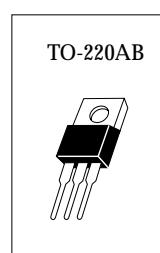

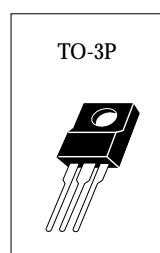

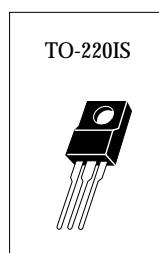

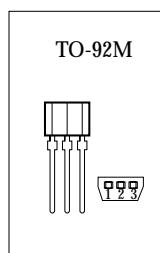

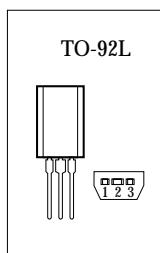

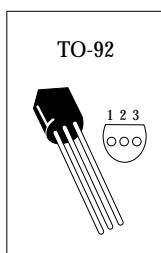

SPI bus

While SSB pin is pulled to “high” or “low” level, the SPI bus operation is selected. And a valid transmission should be starting from pulling SSB to “low” level, enabling MTV021 to receiving mode, and retain “low”level until the last cycle for a complete data packet transfer. The protocol is shown in Figure 1.
