GSM

Specification

	900 MHz	1800 MHz
Frequency Range	Tx: 890 - 915MHz Rx: 935 - 960 MHz	Tx: 1710 - 1785 MHz Rx: 1805 - 1880 MHz
Tx/Rx frequency separation	45 MHz	95 MHz
RF Channel Bandwidth	200 kHz	
Number of RF channels	124	374
Speech coding	Full rate/Half rate/Enhanced Full rate	
Operating temperature	-10 °C to +55 °C	
Type	Class 4 Handheld	Class 1 Handheld
RF Output Power	2 W maximum	1 W maximum
Modulation	GMSK (BT = 0.3)	
Connection	8 ch/TDMA	
Voice digitizing	13 kbps RPE-LTP / 13 kps ACLEP / 5.6 kps CELP / VSLEP	
Transmission speed	270.3 kbps	
Diversity	Frequency hopping	
Signal Reception	Double superheterodyne	
Intermediate Frequencies	225 MHz and 45 MHz	
Antenna Terminal Impedance	50 Ω	
Antenna VSWR	<2.1 : 1	
Dimensions	Height: 118.1 mm Width: 40.5 mm Depth: 16.4 mm (GD92/92C), 21.4 mm (GD52)	
Volume	GD52: 99 ml GD92/92C: 74.5 ml	
Weight	GD52: 99 g GD92/92C: 77 g	
Display	Graphical chip on glass liquid crystal, Alphanumeric, 16 x 3 characters (GD52), 16 x 4 characters (GD92/92C), 5 icons and 6 x 1 characters	
Illumination	4 LEDs for the LCD (Green) 8 LEDs for the keypad (Green) 1 LED Incoming call (Green) 1 Charging LED (Red)	
Keypad	17 keys, Navigation key	
SIM	Plug-in type only	
External DC Supply Voltage	5.8 V	
Battery	GD52: 3.6V nominal, 600mAh, NiMH GD92/92C: 3.7 V nominal, 650mAh, Li-Ion	
Standby Battery Life DRX 9	GD52: 140 hrs GD92/92C: 160 hrs maximum	
Conversation Battery Life PL 7, DTX 50%	GD52: 180 minutes GD92/92C: 210 minutes	

Battery life figures are dependent on network conditions.

WARNING

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service manual by anyone else could result in serious injury or death.

WARNINGS AND CAUTIONS

WARNING

The equipment described in this manual contains polarized capacitors utilising liquid electrolyte. These devices are entirely safe provided that neither a short-circuit nor a reverse polarity connection is made across the capacitor terminals.
FAILURE TO OBSERVE THIS WARNING COULD RESULT IN DAMAGE TO THE EQUIPMENT OR, AT WORST, POSSIBLE INJURY TO PERSONNEL RESULTING FROM ELECTRIC SHOCK OR THE AFFECTED CAPACITOR EXPLODING. EXTREME CARE MUST BE EXERCISED AT ALL TIMES WHEN HANDLING THESE DEVICES.

Caution

The equipment described in this manual contains electrostatic devices (ESDs). Damage can occur to these devices if the appropriate handling procedure is not adhered to.

ESD Handling Precautions

A working area where ESDs may be safely handled without undue risk of damage from electrostatic discharge, must be available. The area must be equipped as follows:

Working Surfaces: - All working surfaces must have a dissipative bench mat, SAFE for use with live equipment, connected via a 1 M Ω resistor (usually built into the lead) to a common ground point.

Wrist Strap - A quick release skin contact device with a flexible cord, which has a built in safety resistor of approximately 1 M Ω shall be used. The flexible cord must be attached to a dissipative earth point.

Containers - All containers and storage must be of the conductive type.

Batteries

This equipment may contain an internal battery in addition to the external battery packs. These batteries are recyclable and should be disposed of in accordance with local legislation. They must not be incinerated, or disposed of as ordinary rubbish.

This page is left intentionally blank.

1 INTRODUCTION

1.1. Purpose of this Manual

This Service Manual contains the information and procedures required for installing, operating and servicing the Panasonic GSM Personal Cellular Mobile Telephone system operating on the GSM Digital Cellular Network.

1.2. Structure of the Manual

The manual is structured to provide service engineering personnel with the following information and procedures:

1. General and technical information - provides a basic understanding of the equipment, kits and options, together with detailed information for each of the major component parts.
2. Installation and operating information - provides instructions for unpacking, installing and operating the equipment.
3. Servicing information - provides complete instructions for the testing, disassembly, repair and reassembly of each major component part. Step-by-step troubleshooting information is given to enable the isolation and identification of a malfunction, and thus determine what corrective action should be taken. The test information enables verification of the integrity of the equipment after any remedial action has been carried out.
4. Illustrated parts list - provided to enable the identification of all equipment components, for the ordering of spare / replacement parts.

1.3. Servicing Responsibilities

The procedures described in this manual must be performed by qualified service engineering personnel, at an authorised service centre.

The service engineering personnel are responsible for fault diagnosis and repair of all equipment described in this manual.

This page is intentionally blank.

2 GENERAL DESCRIPTION

2.1. General

This section provides a general description and kit composition details for the GSM Handportable Telephone system and optional kits.

2.2. Features

2.2.1 Standard Features

Panasonic Telephone Models GD52, GD92 and GD92C are high performance, small, light, handsets for business and domestic use. The following features are included as standard:

1. Triple Rate, which includes Full Rate, Half rate and Enhanced Full Rate (EFR) speech, codec.
2. Dual Band, GSM 900 and GSM 1800 operation.
3. Tegic T9 Text Entry
4. Voice Ringer
5. Desktop Handsfree function comprising integral echo cancellation and noise suppression.

2.2.2 GD92 and GD92C

In addition, GD92 and GD92C have the following features:

1. E-Mail access via Point-to-Point Protocol (PPP).
2. Voice Command dialling.
3. Backup Battery.
4. Four background display colours.

The GD92C has extra RAM to accommodate the Chinese character set.

2.3. Handportable Main Kit

Figure 2.1: Handportable Main Unit Kit Contents

2.3.2 GD52 Contents

ITEM	DESCRIPTION	PART NUMBER
1	Main Unit GD52	EB-GD52
2	Battery, Standard	EB-BSD52
3	AC Adaptor	EB-CAD52
-	Documentation	See Section 7

2.3.3 GD92 Contents

ITEM	DESCRIPTION	PART NUMBER
1	Main Unit GD92	EB-GD92
2	Battery, Standard	EB-BSD92B (Blue) - or EB-BSD92T (Titanium)
3	AC Adaptor	EB-CAD92
-	Documentation	See Section 7

2.3.4 GD92C Contents

ITEM	DESCRIPTION	PART NUMBER
1	Main Unit GD92C	EB-GD92C
2	Battery, Standard	EB-BSD92B (Blue) - or EB-BSD92T (Titanium)
3	AC Adaptor	EB-CAD92
-	Documentation	See Section 7

3 OPERATING INSTRUCTIONS

3.1. General

This section provides a brief guide to the operation and facilities available on the GD52, GD92 and GD92C telephone handsets. Refer to the Operating Instructions supplied with the telephones for full operational information.

3.2. LCD Display

The telephone unit has a graphical chip on glass liquid crystal display in conjunction with the following icons:

Figure 3.1: LCD Display

	Indicates received signal strength: strong signal area; weak signal area.
	Indicates that it is possible to make an emergency call.
Menu Number	The number of the feature indicated by the pointer. To access a feature enter the menu number on the keypad.
	Displays the battery charge level: Battery is at full charge; Battery requires charging; The battery icon flashes during charging. During car mount use, when the battery is fully charged, the icon will not light.
Menu Icon	Displays a small icon related to the current status of the telephone: - telephone is roaming on a non-home network. - using the "Call Divert" feature or the telephone has Call-Divert set; - shows that vibration alert is switched on; - shows that the telephone is in silent mode - no tones; - flashes to indicate that there are unread text (SMS) messages. Lit when SMS area is full; - indicates the telephone is locked; - shows that the normal character set has been selected; - shows that the Greek character set has been selected; - shows that the Extended character set has been selected; - shows that numbers have been selected for text entry.
	Indicates that the navigation key () can be pressed. Each arrow will light individually to indicate which direction is valid.
Option Area	Pressing the select key () will select the option displayed in the option area of the display.

Following some operations, the display will clear automatically after three seconds or after pressing any key except .

3.3. Location of Controls

Incoming / Charge indicator:
Green - Incoming call.
Red - Charging battery pack.

External connector:
Used to connect to external accessories or to charging equipment.

Figure 3.2: Location of Controls

	Navigation Key. Scrolls through options or features menu and increases or decreases volume.
	Select Key. Selects option shown in the Option Area of the display.
	Phonebook Key. Browses through the Phonebook or stores a number in the Phonebook. Changes the type of characters entered during Alpha Entry.
	Send Key. Makes a call.
	Clear Key. Clears the last digit entered, clears all digits when pressed and held or returns to the previous display.
	End Key. Ends a call or switches the telephone on/off when pressed and held.
	Digit keys. Enter wild numbers or pauses when pressed and held. Where appropriate the key scrolls up or down through abbreviated control names and then select to reveal the international access code "+".
	Vibrator enable/disable Key. Press and hold to enable or disable the vibrator.

3.4. Concept of Operation

There is a close relationship between the Select Key, Navigation Key and display.

Figure 3.3: Concept of Operation

Pressing up and down (⬆️⬆️) will move the pointer up and down and scroll through more information in the main area of the display.

Pressing left and right (⬅️➡️) will scroll through options in the option area of the display. To choose the option press the Select Key (⏎️).

3.5. Alpha Entry

3.5.1 Character Set / Key Assignments

Alpha entry is used to enter alphanumeric characters in to the Phonebook, Short Messages and Greeting Message areas

Key	Character / Operation			
	Normal	Greek	Extended	Num
⏎️	" @ - , . : ; ! ? ' & % + - / < > = £ \$ ¥ ¢ §			1
⬅️➡️	A B C a b c	Α Β Γ	Α Ἀ Ἀ Ἐ Β C Ç a à b c	2
⬅️➡️	D E F d e f	Δ Ε Ζ	Δ Ε Ἐ F d e è é f	3
⬅️➡️	G H I g h i	Η Θ Ι	G H I g h i i	4
⬅️➡️	J K L j k l	Κ Λ Μ	J K L j k l	5
⬅️➡️	M N O m n o	Ν Ξ Ο	M N Ñ Ö Œ ø m n ñ o ö ö	6
⬅️➡️	P Q R S p q r s	Π Ρ Σ	P Q R S p q r s ß	7
⬅️➡️	T U V t u v	Τ Υ Φ	T U Ü V t u ü ü v	8
⬅️➡️	W X Y Z w x y z	Ξ Ψ Ω	W X Y Z w x y z	9
⏎️	Deletes the character above the cursor, deletes the character to the left when at the end of the line or clears the entire entry when pressed and held.			

Each time a key is pressed, it will display the next character. When another key is pressed, or no key is pressed for a short time, the cursor will move to the next position.

To cycle between Greek characters (Α Β Γ), extended characters (Α Ἀ Ἀ Ἐ), numerals (0–9) and normal characters (ABC) press ⬅️➡️.

3.5.2 Editing Alpha Entry

Pressing ⬆️⬆️ will move the cursor up or down one line. Pressing ⬅️➡️ will move the cursor left or right one character. When the cursor is moved over a character and another key pressed this will insert the new character.

Pressing ⬅️➡️ will delete the character to the left of the cursor.

3.6. Incoming Call Line Identification (CLI)

When a call is received the last 6 digits of the CLI information is matched with the phonebook. Therefore an incoming call could match to the wrong phonebook entry.

3.7. Hot Key Dial Source List

The source for Hot Key Dial Numbers is normally 'Phonebook' or 'Service Dial Numbers'. For some OEMs it may be a requirement to store these numbers in the EEPROM. When the source is the EEPROM and the telephone software is updated, the source numbers may be lost. Also, if the user changes the source of the Hot Key Dial numbers, it will not be possible to redirect the source back to the EEPROM. However, in the event that an OEM would like the Hot Key Dial source to be stored in the EEPROM, it is unlikely that the user will have the option to change the Hot Key Dial source.

3.8. Features Menu Structure

10202-1

Figure 3.4: Features Menu Structure

3.9. Public Man Machine Interface (MMI)

3.9.1 General

It is possible to operate all GSM telephones in the same way using the Public MMI. The following operations will work with all GSM telephones. However, this information is restricted to those operations supported by GD52, GD92 and GD92C telephones.

The * and # in the following procedures should be replaced by  and  respectively. Also <SND> and <END> should be replaced with  and  keys.

3.9.2 Reading the Phonebook Memory Location

<MEMORY LOCATION>

Leading zeros can be left out of the location number, e.g. 007 can be 7.

3.10. Troubleshooting

The user is given the following information and advised to contact the dealer if the problems persist:

Problem	Cause	Remedy
Telephone will not switch on		Check that the battery pack is fully charged and correctly connected to the telephone.
Extremely short battery life for a new battery pack	The network in use and the condition of the battery pack can affect battery life.	Avoid areas of poor reception. Ensure batteries are fully charged. Additionally, for NiMH batteries, ensure batteries are also discharged fully before recharging.
Short battery life for an old battery pack	The battery pack was worn out.	Replace with a new one.
Short battery life for Ni-MH battery pack	The life of the battery pack is affected by improper charging, this is inherent in all Ni-MH batteries.	To maintain maximum performance, always use until the Low Battery Warning appears and then fully recharge the battery pack. To revive a Battery Pack, use the telephone until the Low Battery Warning appears and then fully recharge three times. However, if the battery life still is short, the battery pack has eventually worn out. Replace with a new one.
The battery level indicator  does not light when charging	If a battery is deeply discharged it will take a short time before there is sufficient power in the telephone to light the battery level indicator  .	Leave to charge for several minutes in temperatures between +5°C and +35°C.
Calls cannot be made	The telephone is locked.	Unlock the telephone (Menu: Security: Phone Lock).
	Outgoing calls are barred.	Disable the outgoing call barring (Menu: Security: Call Bar).
	The telephone is not registered to a network.	Move to a coverage area and operate the telephone after it has registered with a network.
Calls cannot be made from Fixed Dial Store		Check that SIM supports Fixed Dial. Check if the Fixed Dial is switched on (Menu: Security: Fixed Dial). Check the telephone number is stored in the Fixed Dial.
Calls cannot be received	The telephone is not switched on.	Switch the telephone on.
	Incoming calls are barred.	Disable the incoming call barring (Menu: Security: Call Bar).
	The telephone is not registered to a network.	Move to a coverage area and operate the telephone after it has registered with a network.
Emergency calls cannot be made	User's phone is not in a GSM coverage area.	Check that the antenna symbol  is displayed. Move to a coverage area and operate the telephone when the antenna symbol is displayed.
Telephone numbers cannot be recalled	The telephone is locked.	Unlock the telephone (Menu: Security: Phone Lock).
	Fixed Dial is switched on.	Switch off Fixed Dial (Menu: Security: Fixed Dial).

3.11. Important Error Messages

The following table is a list of error messages that may occur during use of the telephone, with a description and suggested course of action:

Error Message	Explanation / Remedy
Area not Allowed	Roaming in the selected area is not allowed.
Network not Allowed	Roaming with the selected network is not allowed.
Security Failure	The network has detected authentication failure because the SIM is not registered with that network. Contact the Service Provider.
SIM Blocked	The SIM is blocked because the wrong PUK has been entered ten times. Contact the Service Provider.
SIM Error	The telephone has detected a problem with the SIM. Switch the telephone off and then back on. If the message does not disappear, contact the Service Provider.
Message Rejected Store Full	A message has been received but the message store is full. To receive messages, delete some of the currently stored messages or set messages to automatically clear (Menu: Messages: Parameters: Auto Delete).
PIN2 Invalidated	The PIN2 is blocked permanently because the wrong PUK2 has been entered 10 times. Services controlled by PIN2 cannot be used. Contact the Service Provider.
Warning Store Full Continue?	The message area is full. New messages cannot be stored until some of the currently stored messages are deleted.
Auto Redial List Full	Redial list of unsuccessfully dialled numbers is full. Switch the telephone off and then on again.

3.12. Security Codes

Code Type	Number of Digits	Description
Personal Identification Number (PIN)	4 to 8	Controls SIM security. Supplied by the service provider.
PIN 2	4 to 8	Controls memory security. Supplied by the service provider.
PIN/PIN 2 Unblocking Key		
(PUK/PUK 2)	8	Used to unblock PIN and PIN 2. A PIN or PIN 2 will become blocked if the wrong PIN or PIN 2 is entered three times. When the blocked PIN or PIN 2 is unblocked, a new PIN or PIN 2 must be entered. If the wrong PUK or PUK 2 is entered 10 times, the cursor SIM will be unusable.
Supplied by the service provider.		
Password	4	Controls the call bar function. If the wrong password is entered three times, this service will be revoked. Supplied by the service provider.
Lock Code	4	Controls telephone security.
Factory set to "0000".		

3.13. SIM Personalisation

3.13.1 Introduction

SIM personalisation will limit the use of the telephone to a single SIM, a SIM supplied by one Network/Sub-network/Service Provider or a SIM purchased by a company (corporation). If a personalised GD52 / GD92 / GD92C contains a SIM that is from a different source it will display the message "SIM ERROR" when switched on. This personalisation is sometimes referred to as SIM lock or SIM latch.

3.13.2 Testing

To test a personalised GD52 / GD92 / GD92C when the user has not supplied the SIM, a SIM configured for test purposes (e.g. test SIM or soft SIM) should be used. The mobile will recognise that the SIM is for testing purposes only and operate as normal.

3.13.3 Personalisation Function

Personalisation is activated during manufacture and then enabled at a later stage. Enabling/disabling is available by entering a special key sequence immediately after power on. Once the enable/disable menu is shown it is possible to select the type of personalisation. When personalisation is enabled it is only possible to disable it if the mobile contains an illegal SIM and the sixteen digit Control Key (CK) is known. When enabled the CK is withheld from the user and cannot be read, for security reasons.

There are two special key sequences to enter the enable/disable menu:

Key Sequence	Notes
	Can only disable personalisation
	Can both enable and disable personalisation

3.13.4 Disabling Procedure

-  or .
-  to point at:
 "SIM" for SIM Personalisation
 "Network" for Network Personalisation
 "Subnetwork" for Subnetwork Personalisation
 "SP" for Service Provider Personalisation or
 "Corporate" for Company Personalisation.
- .
-  the 16 digit Control Key.
- .
-  the 16 digit Control Key.
- .

The display will confirm which type of Personalisation has been disabled.

3.13.5 Enabling Procedure

- .
-  to point at:
 "SIM" for SIM Personalisation
 "Network" for Network Personalisation
 "Subnetwork" for Subnetwork Personalisation
 "SP" for Service Provider Personalisation or
 "Corporate" for Company Personalisation.
- .
-  the 16 digit Control Key.
- .
-  the 16 digit Control Key.
- .

The display will confirm which type of Personalisation has been enabled.

3.14. GSM Services Supported by PC Card

Bearer Service Number	Bearer Service Rate	Access Structure	Access Rate	Information Transfer	Error Correction Options

3.16. Glossary of Terms

Term	Definition
DTMF	Dual Tone Multiple Frequency tones. The numeric keys 0 to 9, and * and # will generate different DTMF tones when pressed during conversation. These are used to access voice mail, paging and home banking services.
GSM	Global System for Mobile communications. The name given to the advanced digital technology that the telephone uses.
Home country	The country in which the home network operates.
Home network	The GSM network on which subscription details are held.
Hot Key Dial	Hot Key Dial allows quick access to numbers stored in the Phonebook of Service Dial Number list. The source of the Hot Key Dial may be defined by the user or preprogrammed by the Service Provider. It is most likely to be preprogrammed to the Service Dial Numbers by the Service Provider.
Lock code	Used for security of the telephone. Factory set to "0000".
Message Centre	Where messages are sent before they are forwarded onto their destination. The Message Centre telephone number may be programmed into the SIM or supplied by the service provider.
Network operator	The organisation responsible for operating a GSM network. Each country will have at least one network operator.
Password	Used for the control of the call bar function. Supplied by the service provider.
PIN	Personal Identification Number used for SIM security. Supplied by the service provider.
PIN2	Personal Identification Number used for the control of Fixed Dial Memory and call charge metering. Supplied by the service provider.
PUK/ PUK2	PIN/PIN2 Unblocking Key. Used to unblock the PIN/PIN2. Supplied by the service provider.
Registration	The act of locking on to a GSM network. This is usually performed automatically by the telephone.
Roaming	The ability to use the telephone on networks other than the Home network.
Service Dial Numbers	Service Dial Numbers are predefined numbers that allow the user to access a set of special services provided by the Service Provider. For example billing information or access to Voice Mail.
Service provider	The organisation responsible for providing access to the GSM network.
SIM	Subscriber Identification Module. A small smart-card which stores unique subscriber and user-entered information such as Phone Book, Fixed Dial Memory and short messages. Supplied by the service provider.
Supplementary service	Network-controlled GSM functions supported by the telephone. Supplementary services may only be available on a subscription bases.
Wild numbers	Spaces in a stored telephone number. When the telephone number is recalled pressing a numeric key will fill in a space. This can be used to restrict dialling to a specific area.

4 DISASSEMBLY / REASSEMBLY INSTRUCTIONS

4.1. General

This section provides disassembly and reassembly procedures for the main components of GD52, GD92 and GD92C telephones.

These assemblies **MUST** be performed by qualified service personnel at an authorised service centre.

The following Warnings and Cautions **MUST** be observed during all disassembly / reassembly operations:

WARNING

The equipment described in this manual contains polarised capacitors utilising liquid electrolyte. These devices are entirely safe provided that neither a short-circuit nor a reverse polarity connection is made across the capacitor terminals. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN DAMAGE TO THE EQUIPMENT OR, AT WORST, POSSIBLE INJURY TO PERSONNEL RESULTING FROM ELECTRIC SHOCK OR THE AFFECTED CAPACITOR EXPLODING. EXTREME CARE MUST BE EXERCISED AT ALL TIMES WHEN HANDLING THESE DEVICES.

Caution

The equipment described in this manual contains electrostatic devices (ESDs). Damage can occur to these devices if the appropriate handling procedure is not adhered to.

4.1.1. ESD Handling Precautions

A working area where ESDs may be handled safely without undue risk of damage from electrostatic discharge, must be available. The area must be equipped as follows:

Working Surfaces

All working surfaces must have a dissipative bench mat, safe for use with live equipment, connected via 1M2 resistor (usually built into the lead) to a common ground point.

Wrist Strap

A quick release skin contact device with a flexible cord, which has an integral safety resistor of between 5k2 and 1M2, shall be used.

Containers

All containers and storage must be of the conductive type.

4.2. Disassembly

4.2.1 Case Removal (GD52)

1. Remove the battery cover by pushing it towards the base of the phone and then lifting it away from the case.

10233-1

Figure 4.1: GD52 Battery Cover Removal

2. Slide the battery lock to the 'release' position, and lift the battery from the case.

10235-1

Figure 4.2: GD52 Battery Removal

3. Remove the four case screws located inside the battery compartment.

10234-1

Figure 4.3: GD52 Case Screw Removal

4. Remove the cover from the case by pulling from the connector end of the telephone. Care must be taken when separating the case from the cover as the retaining clips may be very stiff - if necessary, re-attach the battery cover to provide extra support for the case.

10236-1

Figure 4.4: GD52 Case-Cover Separation

5. Remove the PCB assembly from the cover.

10194-1

Figure 4.5: GD52 PCB Assembly Removal

4.2.2 Case Removal (GD92 / GD92C)

1. Remove the battery from the back of the telephone. Remove the four case screws located inside the battery compartment.

10192-1

Figure 4.6: GD92 / GD92C Screw Removal

2. Remove the cover from the case by pulling from the connector end of the telephone. Care must be taken when separating the case from the cover as the retaining clips may be very stiff. If necessary, re-attach the battery to provide extra support for the case.

10193-1

Figure 4.7: GD92 / GD92C Case-Cover Separation

3. Remove the PCB assembly from the cover.

10194-1

Figure 4.8: GD92 / GD92C PCB Assembly Removal

4.2.3 Changing the Backup Battery (GD92 / GD92C)

Remove the case as previously described. The backup battery is held in a retainer on the Main PCB. Observe polarity when replacing the battery.

10007-1

Figure 4.9: Backup Battery Polarity

4.2.4 Access to Printed Circuit Boards (All)

1. Remove the case as described for the relevant product (GD52 or GD92 / GD92C). While applying slight pressure to the side retaining clips, lift the Main PCB away from the chassis.

10195-1

Figure 4.10: Main PCB Removal

2. While applying slight pressure to the side retaining clips, slide the Keypad PCB towards the bottom (I/O) connector until it is released from the chassis.

Figure 4.11: Key PCB Removal

3. Insert a small screwdriver blade or similar blunt object into the chassis recess to the side of the LCD, and gently prise the LCD from the chassis assembly.

Figure 4.12: LCD Removal

4. The Light Guide and Reflector can be removed in turn by prising one side away from the chassis.

4.2.5. Case-Mounted Components

1. Remove the keypad membrane by peeling it away from the case front.

Figure 4.13: Keypad Membrane Removal

2. Remove the microphone assembly by prising upward with a small screwdriver blade or similar blunt object through the slot in the side of the microphone holder.

Figure 4.14: Removal of Microphone

3. Unclip the speaker holder and lift out the speaker.

Figure 4.15: Speaker Removal

4. Remove the RF Shield by depressing one of the side retaining clips with a small screwdriver blade or similar blunt object.

Figure 4.16: Removal of RF Shield

5. Once the RF Shield has been removed, the Memo button (GD92 / GD92C) and Desktop Handsfree (DTHF) speaker may be lifted out from the case.
6. The Vibrate motor may be removed by gently applying pressure under the spindle / counterweight.

Figure 4.17: Removal of Vibrate Motor

7. Using a small screwdriver blade or similar blunt object, depress the lug on the antenna base in order to release the entire antenna unit.

Figure 4.18: Antenna Removal

4.3. Re-assembly

Re-assembly is the reverse of disassembly, except that the Keypad PCB should be located in the chassis guides adjacent to the base I/O connector before sliding it in to its normal location.

Ensure that the securing screws are not over-tightened as this may affect the operation of the keypad.

This page is intentionally blank.

5 TECHNICAL SPECIFICATIONS

5.1. Tx Characteristics

All data is applicable to GSM 900 and GSM 1800 except where stated.

5.1.1. Frequency Error

± 0.1 ppm max., relative to base station frequency.

5.1.2. Modulation Phase Error

RMS: $\leq 5^\circ$

Peak: $\leq 20^\circ$

5.1.3. Output RF Spectrum due to Modulation

Offset from Centre Frequency (kHz)	Maximum Level Relative to Carrier (dB)
± 100	+0.5
± 200	-30
± 250	-33
± 600 to 1800	-60

5.1.4. Output RF Spectrum due to Switching Transients

Offset from Centre Frequency (kHz)	Maximum Level (dBm)	
	GSM 900	GSM 1800
± 400	-19	-22
± 600	-21	-24
± 1200	-21	-24
± 1800	-24	-27

Measurement conditions for output RF spectrum measurements:

Frequency Span 0 Hz
 Measurement Bandwidth: 30 Hz
 Video Bandwidth: 100 kHz
 Peak Hold

5.1.5. Spurious Emissions at Antenna Connector

Frequency Range	Frequency Offset	Filter Bandwidth	Approximate Video Bandwidth	Limits (dBm)	
				GSM 900	GSM 1800
30 to 50 MHz	-	10 kHz	30 kHz	-36	-36
50 to 500 MHz	-	100 kHz	300 kHz	-36	-36
500 MHz to 1GHz	0 to 1MHz	100 kHz	300 kHz	-36	-36
1 GHz to 4GHz	0 to 10 MHz	100 kHz	300 kHz	-30	-36
Excl. relevant TX band:	≤ 10 MHz	300 kHz	1 MHz	-30	-36
P-GSM: 890 to 915 MHz;	≤ 20 MHz	1 MHz	3 MHz	-30	-36
DCS: 1710 to 1785 MHz	(offset from edge of relevant TX band)				
Relevant TX band:	1.8 to 6.0 MHz	30 kHz	100 kHz	-30	-30
P-GSM: 890 to 915 MHz;	(offset from carrier)				
DCS: 1710 to 1785 MHz					

5.1.6. Output Level, Dynamic Operation

GSM 900

Power Control Level	Transmitter Output Power (dBm)	Tolerance for Conditions (dB)	
		Normal	Extreme
TBA			

GSM 1800

Power Control Level	Transmitter Output Power (dBm)	Tolerance for Conditions (dB)	
		Normal	Extreme
TBA			

5.1.7. Residual Peak Power

≤70 dBc (BW = 300 kHz)

5.2. Rx Characteristics

5.2.1. Sensitivity

GSM 900 Full Rate Speech

The reference sensitivity performance in terms of frame erasure, bit error, or residual bit error rates (whichever is appropriate) is specified in the following table, according to the propagation conditions.

Channels	Propagation Conditions TUhigh		Propagation Conditions RA		Propagation Conditions HT		Static Conditions	
	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples
TCH/FS FER	$6.742 \cdot \alpha$	8900					$0.122 \cdot \alpha$	164000
class Ib (RBER)	$0.42/\alpha$	1,000,000					$0.41/\alpha$	20,000,000
class II (RBER)	8.33	120,000	7.5	24000	9.333	60000	2.439	8200

The reference sensitivity level is < -102 dBm.

NOTE: $1 \leq \alpha \leq 1.6$. The value of α can be different for each channel condition but must remain the same for FER and class Ib RBER measurements for the same channel condition.

GSM 900 Half Rate Speech

The reference sensitivity performance in terms of frame erasure, bit error, or residual bit error rates (whichever is appropriate) is specified in the following table, according to the propagation conditions.

Channels	Propagation Conditions TUhigh		Propagation Conditions RA		Propagation Conditions HT	
	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples
TCH/HS (FER)	4.598	13050				
TCH/HS class Ib (BFI=0)	0.404	148500				
TCH/HS class II (BFI=0)	7.725	25500	8500	20000	7600	20000
TCH/HS (UFR)	6.250	9600				
TCH/HSL class Ib ((BFI or UFI)=0)	0.269	227000				

GSM 1800 Full Rate Speech

The reference sensitivity performance in terms of frame erasure, bit error, or residual bit error rates (whichever is appropriate) is specified in the following table, according to the propagation conditions.

Channels	Propagation Conditions TUhigh		Propagation Conditions RA		Propagation Conditions HT		Static Conditions	
	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples
TCH/FS FER	4.478* α	13400					0.122* α	164000
class Ib (RBER)	0.32/ α	1,500,000					0.41/ α	20,000,000
class II (RBER)	8.333	60,000	7.5	24000	9.333	30000	2.439	8200

The reference sensitivity level is < -102 dBm.

NOTE: $1 \leq \alpha \leq 1.6$. The value of α can be different for each channel condition but must remain the same for FER and class Ib RBER measurements for the same channel condition.

GSM 1800 Half Rate Speech

The reference sensitivity performance in terms of frame erasure, bit error, or residual bit error rates (whichever is appropriate) is specified in the following table, according to the propagation conditions.

Channels	Propagation Conditions TUhigh		Propagation Conditions RA		Propagation Conditions HT	
	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples	Test Limit error rate %	Minimum No. of samples
TCH/HS (FER)	4.706	12750				
TCH/HS class Ib (BFI=0)	0.426	141000				
TCH/HS class II (BFI=0)	7.725	25500	8735	20000	7600	20000
TCH/HS (UFR)	6.383	9400				
TCH/HSL class Ib ((BFI or UFI)=0)	0.291	206000				

Blocking:

Frequency	Small MS level in dB μ Vemf()	
	GSM 900	GSM 1800
FR $\pm$ 600 kHz to FR $\pm$ 800 kHz	70	70
FR $\pm$ 800 kHz to FR $\pm$ 1.6 MHz	70	70
FR $\pm$ 1.6 MHz to FR $\pm$ 3 MHz	80	80
915 MHz to FR -3 MHz	90	-
FR $\pm$ 3 MHz to FR 980 MHz	90	-
FR $\pm$ 600 kHz to FR $\pm$ 800 kHz	-	87
1785 MHz to FR - 3 MHz	-	87
835 MHz to <915 MHz	113	-
>980 MHz to 1000 MHz	113	-
100 kHz to <835 MHz	90	-
>1000 MHz to 12.75 GHz	90	-
100 kHz to 1705 MHz	-	113
>1705 MHz to <1785 MHz	-	101
>1920 MHz to 1980 MHz	-	101
>1980 MHz to 12.75 GHz	-	90

Measurement Conditions:

Wanted carrier is 3 dB above reference sensitivity.

Interferer is CW.

TECHNICAL SPECIFICATIONS

Spurious response exceptions:

Six exceptions are permitted IN band 915 - 980 MHz.

24 exceptions are permitted OUTSIDE band 915 - 980 MHz.

Intermodulation Characteristics

Interferer Level (f1 & f2) dBm	Interferer Frequencies (f1 & f2)
-49	Wanted frequency = $2f_1 - f_2$, and $[f_1 - f_2] = 800$ kHz.

6 TEST AND MEASUREMENT

6.1. Introduction

This section provides information on testing GD52, GD92 and GD92C telephones. The layout is as follows

1. Section 6.2 ALIVH PCBs: Description and repair procedures.
2. Section 6.3 External testing: describes equipment requirements and general set up procedure.
3. Section 6.4 Complete Unit Test Setup: describes how the items of test equipment are used together and general set up procedure.
4. Section 6.5 Channel box test commands: provides detailed explanation of the different commands available using the test equipment and channel-box software.
5. Section 6.6 Adjustment mode: describes adjustments available on the handheld unit.

6.2. Any-Layer Interstitial Via Hole (ALIVH) PCBs

CAUTION

The GD52, GD92 and GD92C telephone handsets use an ALIVH PCB assembly, the substrate of which is hydrophilic. To avoid damaging the ALIVH PCB, the specialist equipment and procedures described below must be employed when replacing suspect or faulty components.

6.2.1. General Information

To reduce overall size and provide enhanced speech and data performance, an Any-Layer Interstitial Via Hole (ALIVH) PCB is used in GD52, GD92 and GD92C handsets. ALIVH PCBs are multi-layer boards which have an IVH structure in all inter-layers and can provide an inter-layer connection immediately under the land of a component. In addition, the PCB has no through holes and any number of layers can be interconnected.

As the specification and performance characteristics of ALIVH PCBs differ from that of conventional multi-layered boards, special attention is required when handling and repairing these assemblies.

Moisture Absorbency

The ALIVH PWB is more absorbent than a conventional PCB because of the nature of its material. Its aramid substrate is hydrophilic, i.e. it absorbs moisture from the air. If, after having absorbed moisture, the ALIVH PWB is submitted to re-flow or repair process, moisture in the board can suddenly evaporate and cause vapour explosion.

Copper Foil Peel Strength (Land Detachment Resistance)

The ALIVH PCB is slightly less resistant to copper detachment force than conventional boards. Therefore, it is necessary to ensure that solder is melted sufficiently before a component is removed from the board.

Warping Property

The ALIVH PCB has a smaller Young's Modulus and is therefore more pliant than conventional boards. It is important that the ALIVH PCB is not bent when component placement is performed.

6.2.2. Repair Procedures

To prevent problems caused by moisture absorption, it will be necessary to perform dehydration of ALIVH PCBs in a suitable oven or similar heating device prior to repair. The boards should be heated at 85 °C for a duration of at least ten hours.

The repair should also be performed under the following conditions:

6.2.2.1. Soldering Iron

The temperature of the tip of the soldering iron should be 350 °C $\pm$ 10 °C for an application time of five seconds or less.

Removal and re-mounting of components should be performed only once at any component position.

Note: To avoid land detachment, do NOT apply excessive force on the soldering iron when heating the board. Ensure that the solder has melted sufficiently to allow component removal without damaging the board.

6.2.2.2. Hot-Air Blower

The blower air temperature should be at:

295 °C $\pm$ 5 °C for an application time of 120 seconds or less,

or:

395 °C $\pm$ 5 °C for an application time of 30 seconds or less.

Removal and re-mounting of components should be performed only once at any component position.

Note: *To avoid land detachment, do NOT apply excessive force on the soldering iron when heating the board. Ensure that the solder has melted sufficiently to allow component removal without damaging the board.*

6.2.2.3. Re-flowing / Re-touching

1. Re-touching by soldering iron:

HAKKO 928 soldering iron is recommended.

900S-T-B tip for thicker solder joints and 900M-T-LB tip for thinner solder joints are recommended

2. Tip temperature/time

Normal pad : 325 $\pm$ 10°C, less than five seconds

Large Pad : 400 $\pm$ 10°C, less than five seconds

3. Pressure at solder tip

· Weight of soldering iron, (50gm) + 100gm to 150gm

· Do not exert pressure in the horizontal direction

4. Retouching small components

Pinch the component using two soldering irons and retouch within four seconds

6.3. External Testing

6.3.1. General Information

The handset can be connected to a compatible personal computer for electronic adjustment and fault diagnosis. This section provides a description of the equipment required to perform those tasks.

Testing and adjustment of the handheld unit can be performed with the outer case in place and the cradle connected. For in-depth fault finding the unit should first be disassembled, as detailed in Section 4, and then the PCB Repair Jig used to connect the PCBs together externally as they would be found in normal use. Fault tracing can then be performed on the PCBs using suitable test equipment, such as spectrum analysers and oscilloscopes.

The unit must now be tested and calibrated for both frequency bands (900 MHz and 1800 MHz).

6.3.2. Jigs and Tools

Interface Box (Part No. IFB003 / IFB004)

The Interface box provides:

IFB003: Voltage regulation for +7.2 V, +5.6 V or 4.8 V DC outputs. The +7.2 V switch setting is used as a supply to Li-Ion type batteries (compatible for other products), the 5.6 V switch setting is used for PCB testing and the 4.8 V switch setting is used for testing the complete unit.

Interface Box IFB004 is a later version that provides +4.8 V, +7.2V and +8.2 V DC outputs. It also allows selection of external power via the Interface cable.

RS 232 interface. Ensures that the Unit Under Test is supplied with the correct signal levels and format.

Figure 6.1: Interface Box IFB003 / IFB004

6.3.3. Personal Computer (PC)

The PC (IBM compatible) is used as a Unit Under Test controller. This in conjunction with the channel box software, allows all of the test facilities normally provided through the keypad of the Unit Under Test.

6.3.4. Power Supply

Provides 12 V DC supply to Interface box IFB003 or IFB004.

Test Battery

Provides 3.6 V DC supply to Interface Box IFB003 or IFB004 to compensate for the current drain when the Unit Under Test is used at full transmit power.

Use Test Battery part number JT00045 for GD52 and part number JT00042 for GD92 and GD92C.

Figure 6.2: Test Battery

PCB Repair Jig (Part No. JT00041)

This unit provides the necessary connections between the Main and Keypad PCBs, and the connections between Main PCB and external test equipment. The jig accommodates both GD52, GD92 and GD92C units.

10265-1

Figure 6.3: PCB Repair Jig

RF Adaptor

This unit provides an RF connection between the Unit Under Test and external test equipment. Use part number JT00044 for GD52 and JT00040 for GD92 / GD92C.

10232-1

Figure 6.4: GD92 / GD92C RF Adaptor

GSM Tester

This unit acts as a base station providing all the necessary GSM signalling requirements and also provides GSM signal measuring facilities.

Interface Cable (Part No. JT00043)

The interface cable allows connection between a computer and the Unit Under Test via IFB003 or IFB004.

10266-1

Figure 6.5: Interface Cable

Battery Calibration Voltage Control Unit (Part No. JT00010)

The Battery Calibration Voltage Control Unit (BCVCU) provides three voltage levels (3 V, 4.1 V and 0 V) to the Test Battery, and is used during battery calibration checks. It is powered from the Interface Box.

Figure 6.6: Battery Calibration Control Unit

6.3.5. Channel Box Software

This is the test software for the telephone unit and should be installed onto the personal computer to be used for testing.

6.4. Complete Unit Setup

10199-1

Figure 6.7: Complete Unit Test Setup

6.4.1. External Testing Setup Procedure

IMPORTANT NOTE

To allow accurate measurement of the complete unit the test equipment must be connected as shown (Figure 6.6). The PCB Test Setup must be used to enable repair to PCBs. Once repair/replacement is complete, the assembled unit must be tested and calibrated with the jigs and tools connected as shown in Figure 6.7.

Full Test Equipment Requirements

For testing the handheld unit the following equipment is required:

1. Interface box
2. 12 V power supply
3. Personal computer (IBM compatible) with RS232 interface
4. RS232 interface cable (9 pin straight through connection)
5. GSM test station
6. RF Adaptor
7. Interface cable – JT00004

The channel box software (supplied on floppy disk) should be installed onto the main drive of the personal computer.

The RF cable is connected to the GSM test station via a suitable adapter. The 12 V supply is connected to the rear socket of the Interface box.

Two modes are available for testing the handheld unit:

1. Test Mode.

The Test Mode facility allows various sections of the handheld unit to be individually activated.

2. Normal Mode.

The Normal Mode facility allows the handheld unit to be powered externally for call origination/receiving operations.

NOTE: A suitable test SIM card will be required which is compatible with the GSM test station.

Power On into Test Mode

1. Connect the test equipment into test mode configuration.

Figure 6.8: External test equipment setup

2. Ensure that the following settings are made:

- a. Interface box IFB003 or IFB004

Power:	UP position
IGN:	UP position
Mode	DOWN position
Voltage	Middle Position (7.2 V)

TEST AND MEASUREMENT

- b. Power supply
+12V DC: ON
- c. PC
Channel box software loaded and the screen indicating as shown:

```
TEST-SET MODE <CH-BOX>
NORMAL MODE <Emulat>
SOFT-SIM MODE <Emulat>
```

[ESC] to END of PROGRAM

10027-1

Figure 6.9: PC Screen (SCRN10)

- 3. Press ENTER on the PC keyboard.
- 4. At the PC press F10.
- 5. After approximately 1 second, set the Interface Cable switch to ON (position is marked by a dot).

NOTE: The display will read:

```
GET STATION
ADDRESS = _ _
INFO = _ _
```

The back light will be illuminated and all LEDs will be lit.

Go to Section 6.5 (Channel Box Test Commands) for further testing information.

Power On In Normal Mode

- 1. Connect the test equipment as shown in the diagram.

10238-1

Figure 6.10: External test equipment setup

- 2. Ensure that the following settings are made:
 - a. Interface box IFB003 or IFB004
Power: DOWN position
IGN: UP position
MODE: UP position
 - b. Power supply:
+12V DC: ON
 - c. PC
Channel box software loaded and the screen indicating as shown:

```

TEST-SET MODE <CH-BOX>
NORMAL MODE <Emulat>
SOFT-SIM MODE <Emulat>

```

[ESC] to END of PROGRAM

10027-1

Figure 6.11: PC Screen (SCRN9)

- On the PC, select NORMAL MODE and press ENTER.
- Press F10 on the PC.
- After approximately 1 second, set the interface cable switch to ON (position is marked by a dot).

Entering Call Mode from Test Mode

Ensure that a fully-charged battery is attached to the telephone.

The screen of the PC should resemble the one shown below:

```

<<< PANASONIC GD92 SERVICE BOX VER: 1.00 >>> 2000/04/04 09:18:52

Figure 6.12: PC Screen (SCRN11)

- At the PC, change the SOFT SIM field to read <ENABLE>. Press ENTER.
- At the PC, change the TEST MODE field to read <TERM>. Press ENTER.
The UUT will power down and up again. If the UUT is connected to a GSM test set, after a delay of approximately five seconds, the UUT will register service.
- To return to test mode, set the SOFT SIM field to <DISABLE> and set the TEST MODE field to <TEST>. Press Enter.

6.5. Channel Box Test Commands

The following table outlines the commands available using the channel box software.

After the telephone unit has been switched on (Section 6.4), use the up / down cursor keys on the PC keyboard to select the channel box command. Use the left / right cursor keys to display the required indication and then press the ENTER key to select the displayed function.

CHANNEL BOX COMMAND	INDICATION	FUNCTION
TEST MODE	<TERM> <ReST>	Terminates test mode. Restarts test mode
INITIALIZE	<INIT>	When RETURN is pressed this will reset the default channel settings.
CHANGE CH GSM	<xxx>	Sets up predefined channel settings for GSM frequencies.
CHANGE CH DCS	<xxx>	Sets up predefined channel settings for DCS frequencies.
POWER LEVEL	<xxx>	Allows a specified power level to be set at the UUT.
TX DATA	<NRL 0> <NRL 1> <NRL R> <ACC R>	Sets TX Modulation to Normal burst DATA all 0s Normal burst DATA all 1s Normal burst DATA all random Access burst DATA random
RSSI (DBM)	<xxx>	Provides an RSSI reading on the User specified channel.
SET AGC 1	<xxx>	Allows changes to AGC levels on LOW, MIDDLE, HIGH channels.
SET AGC 2	<xxx>	
SET AGC 3	<xxx>	
SP LOOP BACK	<START> <STOP>	Provides an audio path for use with the GSM test station Sets audio loop-back from TX audio to RX audio without processing by the CODEC
PATH CONT	<MOSO> <MESI> <MESE> <MISI> <MISE>	Sets audio paths: MIC off speaker off MIC external speaker internal MIC external speaker external MIC internal speaker internal MIC internal speaker external
VOL. BUZZ	<xx>	Sets buzzer volume between values 0 to 3 (Min to Max)
VOL. SIDE	<xx>	Sets 4 side tone volume levels between 0dB and -18dB
VOL. MIC	<xx>	Sets 8 MIC volume levels between 26dB and 40dB
VOL. SP1	<xx>	Sets speaker pre-amp volume levels
VOL. SP2	<xx>	Sets speaker volume levels
GET KEY CODE	<ENABLE><DISABLE>	Displays the value of a key pressed on the keypad
CONTROL OUT	<LED R> <LED B> <CHARGE ON> <LED C> <HF ON> <ALL OFF> <ALL ON>	Switches on Incoming LED Switches on Backlight LEDs Switches charge sequence on LCD Switches on Charging LED Switches on handsfree mode Switches off all above Switches on all above
CHECK LCD1	<P1> <P2>	Provides 50% visual display of check pattern on the UUT LCD Provides 50% visual display of check pattern on the UUT LCD
SET ER.DISP	<ENABLE> <DISABLE>	Unit error codes will be displayed on the UUT display Unit error codes will not be displayed on the UUT display
SOFT SIM	<ENABLE> <DISABLE>	With ENABLE set and TEST MODE <TERM> the UUT is removed from test mode and can be placed into call mode

CHANNEL BOX COMMAND	INDICATION	FUNCTION
TEST MODE	<TERM>	With SOFT SIM <ENABLED> the UUT will be removed from test mode and can be placed into a call
SIM STATUS	<SHOW>	Checks and displays the SIM status
CHECK SUM	<SHOW>	Displays the software checksum

6.6. Adjustment Mode

6.6.1. RF Calibration Procedure

NOTE: See Section 6.2 for a list of the equipment and setup procedures required to perform the following adjustment and calibration procedures.

The following procedures MUST be performed after replacement or repair of one or both of the PCBs in the handheld unit. Failure to do so may result in incorrect operation of the telephone.

The following adjustments MUST be made on BOARD PAIRS.

There are three distinct calibration procedures to adjust RF performance. These procedures are:

1. Ramping gain (Section 6.6.1)
2. RSSI (Section 6.6.2)
3. I and Q values (Section 6.6.3)

The adjustment data selected during calibration is stored in Flash ROM.

6.6.2. Ramping Gain

The carrier power must be measured and calibrated for each power level at channel 62.

GSM 900

NOTE: To ensure that the telephone operates within set SAR margins, Panasonic recommends that a power meter capable of measurement to an accuracy of ± 0.2 dB is used when calibrating power levels. Use of a less accurate power meter may result in the telephone failing to meet SAR standards.

1. Power on the telephone in Test Set Mode.
2. Scroll down the menu until CHANGE CH <62> is highlighted and then press ENTER.
3. Scroll down the menu until PL <5> is highlighted. Use the left and right cursor keys to select <14>. Press ENTER.
4. Scroll down the menu until TX DATA <OFF> is highlighted. Using the left / right cursor keys, highlight <NRL R> and press ENTER.

TEST AND MEASUREMENT

5. At the power meter, measure the peak power.
6. If measured power is in the range of the target power, then proceed to step 10.
7. At the Channel box, press F7 to view the TRIM for the mid-channel.

Figure 6.14: Power level view 1

8. Select VIEW TRIM PL MCH, and make a note of this value.

Figure 6.15: Power level 2

9. Perform the following calculation and make a note of the result:

$$\text{New Trim Value} = \text{Old Trim Value} + (\text{Required Power} - \text{Measured Power}) \times \text{Change per dB}$$

(step 5)
(table)
(step 2)
(table)
10. At the Channel box, press F6 to program the TRIM for the mid-channel.

```

10244-1

Figure 6.17: Power level selection 2

12. Highlight the PL14 field and press ENTER.

Figure 6.18: Power level selection 3

13. Enter the value calculated in step 9 into the data field and then press ENTER.
14. Press ESC.
15. Re-measure the peak power.
16. Repeat steps 5 to 14 for the remaining power levels, in the following order:
 - PL6, PL9, and PL19.
 - Power levels between PL9 and PL6.
 - Power levels between PL14 and PL9.
 - Power levels between PL19 and PL14.
17. Calibrate PL15 (limits ± 0.2 dB).
18. After calibrating at channel 62, the carrier power must be measured and calibrated at LOW and HIGH channels as shown in the table below.

Channel	GSM 900	GSM 1800
Low	1	512
Mid	62	698
High	124	885

19. Repeat steps 2 to 14 for the GSM 1800 settings in the following order:
 - PL10 (limits ± 0.5 dB).
 - PL1, PL5, and PL15.
 - Power levels between PL1 and PL4.
 - Power levels between PL15 and PL10.
 - Power level PL0 (limits ± 0.2 dB).

6.6.3. RSSI

This procedure describes the calibration of RSSI on the mid-channel. This procedure must also be carried out for low / bottom channel and high / top channel.

The procedure is as follows:

1. Power the GD92 into Test Set mode in the service channel box.
2. Connect the telephone to the GSM Test Set and apply a carrier frequency of 68 kHz (for channel 60 = 947.00 MHz) at an input level of -90 dBm.
3. At the channel box, highlight CHANGE CH, and, using the left / right cursor keys, select CH <60>. Press ENTER.
4. Highlight the SET AGC1 field and change the set value to 45 dB. Press ENTER.
5. Highlight the RSSI dBm <> field and press ENTER

Figure 6.19: RSSI dB field

6. If the measured power is not -90 ± 1 , then make the following calculation:

$$\begin{aligned} \text{RSSI offset value} &= [-(90 + \text{MEASURED RSSI VALUE})] \times 2 \\ &= [-90 - \text{MEASURED RSSI VALUE}] \times 2, \end{aligned}$$

for example $[-(90 + (95))] \times 2$
 $= [-90 - (-95)] \times 2$
 $= 10$

Record the result.

7. At the channelbox, press F7 to view data.

Figure 6.20: RSSI reading 1

8. Select TRIM OTHER and make a note of the RSSI COMP GSM reading.

Figure 6.21: RSSI reading 2

9. Press ESC.
10. At the Channel box, press F6 to program data.

Figure 6.22: RSSI reading 3

11. Select TRIM RSSI and press ENTER.
12. Highlight RSSI Mch GSM and press ENTER.
13. Make the following calculation:
 RSSI Offset Value (step 8) + reading noted in step 6.
 Enter the result in to the RSSI Mch field.
14. Press ENTER.
15. Press ESC.
16. Measure the RSSI level again by highlighting the RSSI dBm field again and press ENTER.

17. Repeat steps 6 to 16 for both low / bottom and high / top channels.

Channel	GSM 900
Low / bottom	1
Mid	60
High / top	111

18. Repeat steps 6 to 16 for GSM 1800 on the following channels with the SET AGC 1 field set to 51 dB:

Channel	GSM 1800
Bottom / low	512
Mid	650
High / top	885

6.6.4. I and Q Values

NOTE: With the I, Qch adjustment procedures, the transmitter must be set to Power Level 5 (this represents the worst case of non-linearity) so care must be taken that the spectrum analyser used can accept a signal input of 33 dBm. If not, an appropriate attenuator must be used.

I, Q ch Offsets

Spectrum analyser setup:

Centre frequency = 902.4 MHz

RBW = 10 kHz

VBW = 10 kHz

span = 1 MHz

sweep time = 2 sec

1. Set the Channel box to channel 62 at power level 5, nominal burst modulated with all 1's, as shown below:

```

<<< PANASONIC GD92 SERVICE BOX VER: 1.00 >>> 2000/04/04 16:44:17

Figure 6.23: Channel box setup

2. On the spectrum analyser, measure the image leak ratio.

Image leak ratio is the measured ratio of peak power and the power at 135 kHz below peak frequency.

Example:

Peak power = 33dB

Power at 135 kHz below peak power = -9 dBm

Image leakage ratio = 33 dBm - (-9dBm) = 42 dBm

3. If the image leak ratio is greater than 30 dBc, then proceed to 'IQ ch gain calibration'.

IQ Gain Check

1. At the Channel Box, press F6 and select TRIM OTHER.
2. Scroll down until IQCH GAIN is highlighted. Press Enter.

Figure 6.24: I, Q data selection field1

3. Enter '1' (for -0.25 dB) into the data field and press ENTER.

Figure 6.25: I, Q data selection field 2

4. Measure the image leak ratio. If the image leak ratio is greater than 30 dBc, the telephone is within limits. If the image leak ratio is less than 30 dBc, repeat steps 1, 2 and 3 with the following IQ Ch gain values:
 - 0.50 dB (enter '2')
 - 0.75 dB (enter '3')

6.6.5. Battery Calibration

Preliminaries

There are three procedures to calibrating the battery, voltage, temperature and charging calibration. A Battery Calibration Voltage Control Unit (BCVCU) is used to provide the necessary voltage levels for these checks. The BCVCU replaces the two regulated power supplies and 82 Ohm resistor required to calibrate previous mobile products.

1. Connect the telephone, test battery, BCVCU and Interface Box as shown in the diagram below.

10162-1

Figure 6.26: Battery calibration test connections

2. Set the Interface box to POWER ON, IGN and EXT PWR OFF.

Voltage Calibration

1. Enter Test-Set mode in Service Channel Box.

10253-1

Figure 6.27: Battery calibration 1

2. Press F4 and select VIEW ADC LINES.
3. Observe the ADIN1 value. This value is BAT VOLT HIGH. If this reading is outside the range 564 - 664, then there is a fault and further investigation is required. Otherwise, record this value for later use.

Figure 6.28: Battery calibration 2

4. Set VBAT to 3.0 V by selecting 3.0 V on the BCVCU.
5. On the PC, press 'Y' and then ENTER.
6. Check the ADIN1 reading again - this is the BAT VOLT LOW value. If the reading is outside the range 390 - 490, there is a fault and further investigation is required. Otherwise, record this value for use later.
7. Press 'N' in the {repeat yes / no box}, then press ENTER.
8. Press F6. Scroll down to, and select TRIM OTHER.
9. Scroll down to, and select BAT VOLT HIGH. Enter the value recorded in step 3.

Figure 6.29: Battery Calibration 3

10. Press F6. Scroll down to TRIM OTHER and press ENTER.
11. Highlight BAT VOLT HIGH and press ENTER. Type in the value recorded in step 6.

Figure 6.30: Battery calibration 4

- Set the BCVCU to 12 V.

Temperature Calibration

- Ensure that VBAT is set to 4.1 V. Check that EXT PWR and IGN on the Interface Box is set to OFF.
- Scroll up the menu until CONTROL OUT is highlighted. Using the left / right cursor keys, highlight AADC ON and then press ENTER.
- Press F4 and select VIEW ADC LINES.
- Check the value for ADIN3 (BAT TEMP). If the value is outside the range 168 - 248, then there is a fault and further investigation is required. Otherwise, subtract this value from the theoretical value of 208 and record the result for later use.

Figure 6.31: Temperature calibration 1

- Press 'N' in the {repeat yes/no box}, then press ENTER.
- Press F6. Scroll down and highlight TRIM OTHER. Press ENTER.
- Highlight BAT TEMP and press ENTER to select. Enter the value recorded in step 4.

10258-1

Figure 6.32: Temperature calibration 2

Charging Calibration

- On the Interface Box, ensure that the EXT PWR switch is ON. Check that the BCVCU 82 Ohms switch is set to ON.
- Holding down the Shift key, press F4. Select PROG CHARG-DAC DATA.

10259-1

Figure 6.33: Charging calibration 1

- Enter a value of 439.
- Highlight CNTROL OUT and, using the left / right cursor keys, select CHAR ON. Press ENTER.

```

<<< PANASONIC GD92 SERVICE BOX VER: 1.00 >>> 2000/04/05 13:15:17

Figure 6.34: Charging Calibration 2

5. Disconnect VBAT by setting the BCVCU Voltage switch to OFF.
6. Measure the voltage across the Test Battery terminals. If the voltage is within the range 4.2 V $\pm$ 5 mV, proceed to step 11. Otherwise, calculate the difference (DAC STEP) as follows:

$$\text{difference} = (\text{measured voltage} - 4.2 \text{ V}) / 7.4 \text{ mV}$$
7. Press Shift + F4.
8. Scroll down and select PROG CHARG-DAC DATA and enter the value calculated by subtracting the value recorded in step 6 from the initial CHARG-DAC DATA value (439).
9. Repeat steps 6 to 8 until the measured voltage is 4.2 V $\pm$ 5 mV.
10. If the final value is outside the range 342 - 542, then there is a fault and further investigation is required. Otherwise, record the value for use later.
11. Press F6. Highlight TRIM OTHER and press ENTER. Highlight DAC REFERENCE and press ENTER.

```

Figure 6.35: Charging calibration 3

12. Enter the value recorded in step 10.

Figure 6.36: Charging calibration 4

Current Charging ADC Calibration

It is important to monitor the current when charging the Li-ion battery, both to protect against over-current and to determine when charging is complete. The telephone uses the VCC3 and MADC (ICHG) connections of OMEGA to measure charging current as an amplified voltage across a sense resistor.

NOTE: This calibration procedure *MUST* be carried out once Charging Voltage calibration has been completed.

1. Press F4 and select VIEW ADC LINES. Read ADIN5 (CRG CURRENT) and record this value.

Figure 6.37: ADC Calibration

2. If this value is outside the range 101 - 251, then there is a fault and further investigation is required. Otherwise, calculate the difference between the recorded value and the theoretical value of 161. Record this value for use later.
3. Press F6 and select TRIM OTHER. Select COMP OFFSET and enter the value recorded in step 2.
4. Press F9. Wait for the prompt "Saving EV Trim data" to disappear, turn OFF the power supplies and disconnect the telephone.

7.5.2. Identification of Individual Instructions

On the rear cover of each manual there is a part number. The suffix to this number is the issue level of the manual. For example, the part number for the English GD92 Instruction is 7LB825A, where the final 'A' shows the manual is issue 'A'.
